Subject: Second Quarter 2021 Groundwater Monitoring Report and Domestic Well Sampling Results, Site-wide Groundwater Monitoring Program, Pacific Gas and Electric Company, Hinkley Compressor Station, Hinkley, California

Dear Ms. Zimmerman and Ms. Lopez:

Enclosed are the Second Quarter (April through June 2021) groundwater monitoring and domestic well sampling results for the Site-wide Groundwater Monitoring Program (GMP) for the Pacific Gas and Electric Company (PG&E) Hinkley Site (the site; Global Identification No. SL0607111288). This Second Quarter 2021 Groundwater Monitoring Report and Domestic Well Sampling Results Report (report) is being submitted in accordance with the California Regional Water Quality Control Board, Lahontan Region (Water Board) Cleanup and Abatement Order No. R6V-2015-0068¹ (2015 CAO) dated November 4, 2015.

PG&E plans to evaluate chromium concentrations in the Upper Aquifer throughout the Hinkley and Water Valleys as part of the background studies with the Technical Working Group, which includes the Water Board, United States Geological Survey, Community Advisory Committee, and Independent Review Panel. Further updates to the assessment of the nature and distribution of chromium will be forthcoming as the background study concludes.

¹ Water Board. 2015. Cleanup and Abatement Order R6V-2015-0068 Requiring Pacific Gas and Electric Company (PG&E) to Clean Up and Abate Waste Discharges of Total and Hexavalent Chromium to the Groundwaters of the Mojave Hydrologic Unit, for PG&E Compressor Station, Hinkley, San Bernardino County. November 4.

Executive Summary

This Second Quarter 2021 Groundwater Monitoring Report and Domestic Well Sampling Results presents results of groundwater sampling completed during Second Quarter 2021 as part of the Site-wide Groundwater Monitoring Program (GMP) and Domestic Well Sampling Program (DWSP). These programs are associated with the groundwater chromium plume at and near the Pacific Gas and Electric Company (PG&E) Hinkley Compressor Station (the site) located in Hinkley, California.

The GMP is being conducted in compliance with a Cleanup and Abatement Order (CAO) issued by the California Regional Water Quality Control Board, Lahontan Region (Water Board). The current GMP was established in CAO No. R6V-2015-0068 (2015 CAO; Water Board 2015b), issued on November 4, 2015. The DWSP was also revised in the 2015 CAO, and the sampling frequency is further modified annually (Arcadis 2017a, 2017b, 2018a, 2018b, 2019a, 2021a; Water Board 2017a, 2018, 2019, 2020). The sampling frequency changes implemented are documented in Appendix C of the Annual Cleanup Status and Effectiveness Report (Arcadis 2021a). Sampling and reporting for Second Quarter 2021 GMP and DWSP events were conducted in accordance with the 2015 CAO and the revised sampling frequencies.

Second Quarter 2021 Groundwater Monitoring

During Second Quarter 2021, groundwater samples were collected from 361 wells (including water supply wells, extraction wells, and remediation performance monitoring wells) and 31 domestic and other private supply wells in response to the sampling requirements of the 2015 CAO and other site-wide monitoring programs. All samples were analyzed for hexavalent chromium (Cr[VI]) and/or total chromium (Cr[T]) as appropriate. Samples collected from select monitoring wells were also analyzed for constituents other than Cr(VI) and Cr(T) (e.g., nitrate) for other monitoring purposes. Groundwater levels in both the Upper Aquifer (UA) and Lower Aquifer (LA) were measured to assess groundwater gradient and flow directions.

For the purposes of site-wide groundwater monitoring and reporting, the groundwater monitoring wells were subdivided and classified into the following three aquifer zones: the shallow zone of the UA, the deep zone of the UA, and the LA.

Chromium Monitoring Results

The chromium sampling results from Second Quarter 2021 were used to update the site-wide GMP chromium distribution figures for the UA and LA (Figures 5-1 through 5-5). The Second Quarter 2021 chromium plume outlines for the UA are compared with those from First Quarter 2021 on Figure 5-6 and are discussed in Section 5.4. In general, Second Quarter 2021 chromium plume outlines were generally similar to those defined by First Quarter 2020 concentrations with the following exceptions:

- The inferred 3.1/3.2 microgram per liter (µg/L) chromium isoconcentration contour was contracted west of MW-226S in the Northern Disputed Plume Area.
- The 3.1/3.2 µg/L chromium isoconcentration contour was contracted east of G-5R near Alculia Road and east of MW-108D near Mountain View Road north of the Barstow-Bakersfield Highway.
- A bubble 3.1/3.2 µg/L contour was removed from MW-69S north of Alculia Road.
- Isolated bubble 3.1/3.2 µg/L contours were added around wells MW-153S, EX-36, and MW-66 north of the Barstow-Bakersfield Highway near Serra Road.

Second Quarter 2021 Groundwater Monitoring Report and Domestic Well Sampling Results

- The 3.1/3.2 µg/L chromium isoconcentration contour was contracted west of MW-214S, MW-110S, and MW-216S near Acacia Street.
- The 3.1/3.2 µg/L chromium isoconcentration contour was expanded west of MW-220S south of Community Boulevard.

In accordance with the 2015 CAO, sampling in monitoring or domestic wells located southwest of the Lockhart Fault or east of Dixie Road is not required for plume contouring. Monitoring wells in these areas were not sampled during the current quarter.

Domestic Well Sampling Program

During Second Quarter 2021, 31 domestic and other private supply wells were sampled as part of the DWSP. Two of the wells sampled (23-30 and 28N-05) exhibited concentrations of Cr(VI) and/or Cr(T) exceeding 3.1 and 3.2 µg/L, respectively. Well 23-30 is PG&E-owned and located south of Thompson Road, between Summerset and Mountain View Roads. Cr(VI) and Cr(T) concentrations in well 23-30 were 3.2 µg/L and 3.2 µg/L, respectively. Well 28N-05 is located in the northern portion of the DWSP area in Water Valley, west of Hinkley Road and south of Sunset Road (Halsted Road). Cr(VI) and Cr(T) concentrations in well 28N-05 were 3.4 µg/L and 3.1 µg/L, respectively, during the Second Quarter of 2021. Cr(VI) and Cr(T) concentrations in 28N-05 have been above 3.1 µg/L and 3.2 µg/L, respectively, since the well was first sampled in July 2012.

PG&E will continue quarterly sampling of domestic supply wells in accordance with the 2015 CAO. The next domestic well sampling event is scheduled to be completed by September 30, 2021, and the results will be presented in the Third Quarter 2021 Groundwater Monitoring Report.

1 Introduction

This Second Quarter 2021 Groundwater Monitoring Report and Domestic Well Sampling Results Report (report) presents results of the groundwater sampling completed during Second Quarter 2021 as part of both the Site-wide Groundwater Monitoring Program (GMP) and the Domestic Well Sampling Program (DWSP) for the groundwater chromium plume associated with Pacific Gas and Electric Company's (PG&E's) Hinkley Compressor Station located in Hinkley, California (the site). Figure 1-1 provides a location map for the site, and Figure 1-2 presents key place names or features mentioned throughout this report.

1.1 Groundwater Monitoring Program

Groundwater at the site is being monitored and sampled in compliance with a Cleanup and Abatement Order (CAO) issued by the California Regional Water Quality Control Board, Lahontan Region (Water Board 2015b). The purpose of the GMP is to monitor and document chromium concentrations in groundwater beneath the site. The GMP wells are sampled in quarterly, semiannual, annual, and biannual monitoring events. The Second Quarter 2021 groundwater monitoring event, conducted in April through June 2021 and presented in this report, is a semiannual monitoring event under the approved GMP.

1.1.1 Regulatory Framework

In 2015, a new GMP was established in CAO No. R6V-2015-0068 (2015 CAO; Water Board 2015b). The 2015 CAO identifies the domestic and monitoring wells to be sampled, frequency of sampling, and reporting requirements. The 2015 CAO replaces previous CAOs and directives. The Second Quarter 2021 groundwater sampling and reporting followed the requirements documented in the 2015 CAO. The 2015 CAO acknowledges that chromium concentrations in the areas southwest of the Lockhart Fault (as projected) and on or east of Dixie Road are not likely related to PG&E's historical release and, therefore, do not need to be included in plume contours. There were no wells sampled under the chromium program in this area during the current quarter, except for domestic wells under Board Order R6V-2014-0023 (Agricultural Treatment Unit [ATU] Waste Discharge Requirements [WDRs]; Water Board 2014).

During First Quarter 2021, Arcadis U.S., Inc. (Arcadis) evaluated the sampling frequencies for monitoring wells per the requirements of the 2015 CAO and, consequently, proposed sampling frequency changes. The sampling frequency changes implemented are documented in Appendix C of the Annual Cleanup Status and Effectiveness Report (Arcadis 2021a). The revised sampling schedule was implemented beginning in First Quarter 2021.

The 2015 CAO (Section III.B.1.a) requires the use of domestic wells for contouring if they are in the northern area, where no monitoring well is located within 0.5 mile of the domestic well. In all other areas of the site, domestic wells are not used to define chromium contouring. Where domestic wells are required to be used for chromium contouring, the boundary lines are dashed on the figures to indicate uncertainty.

Previously, the California Department of Public Health (CDPH) adopted a maximum contaminant level (MCL) specific to hexavalent chromium (Cr[VI]) of 10 micrograms per liter (µg/L; Water Board 2015a). On August 1, 2017, the Water Board issued a resolution to remove the 10 µg/L Cr(VI) standard.

1.1.2 Groundwater Monitoring Approach and Organization

The groundwater investigation network consists of approximately 652 monitoring wells and piezometers distributed throughout a study area that is approximately 4 miles wide and approximately 10 miles long. Installation of this network began in 1988, and construction and sampling of new wells continues, as directed by the Water Board and as needed by PG&E, to complete the groundwater remediation project. No new wells were installed in Second Quarter of 2021. The significant size of this study area has necessitated its division into three geographical subareas: South Hinkley Valley, North Hinkley Valley, and Water Valley. Each subarea is discussed separately throughout this report, as necessary, and their locations are shown on Figure 1-2.

The U.S. Geological Survey (USGS) has recently published new information on the Lockhart Fault Zone in the vicinity of the site (Figure 1-2) (Miller 2018, Miller et al. 2020). The USGS efforts to develop a greater understanding of the Lockhart Fault Zone were conducted as one part of several elements in the Hinkley chromium background study (Izbiki and Groover 2018). A final chromium background study report is pending; however, the improved understanding of the Lockhart Fault Zone revealed in Miller et al. (2020) has shown there to be numerous fault splays present throughout the southern plume area. As noted in Miller et al. (2020), the hydrologic character of individual fault splays is not known, and it is possible that more fault strands exist. These uncertainties associated with the Lockhart Fault Zone result in difficulty predicting the effects of the fault strands on groundwater movement. The additional Lockhart Fault Zone splays are shown on Figure 1-2 as dashed black lines. The hydrologic influences of these newly identified fault splays within the plume core areas, containing the highest chromium concentrations on site, are just beginning to be understood. However, the fault splays represent a significant additional subsurface complexity that will need to be evaluated and incorporated into future remedial design, operations, and groundwater flow modeling.

Numerous investigations have been completed in South and North Hinkley Valleys, and PG&E's interpretation of the hydrostratigraphy in these areas has been documented in many reports including Stantec's Compliance with Provision 1.C. of Cleanup and Abatement Order No. R6V-2008-0002-A4 and Requirements of Investigation Order No. R6V-2013-0029 (Stantec 2013). In contrast, in Water Valley, hydraulic testing data for wells in this area are limited; therefore, the groundwater flow conditions and the nature and extent of chromium in groundwater in Water Valley are less understood. Monitoring wells throughout the three subareas are constructed based on the interpreted hydrostratigraphy and are classified into groups as described below. The nomenclature associated with this monitoring well network reflects the hydrostratigraphy when feasible; variations in naming conventions indicate evolving interpretations as more wells are constructed and more information is gathered.

Groundwater beneath the site generally occurs in alluvial fill material, river deposits, or weathered bedrock, and the saturated thickness of the aquifer varies from several feet on the valley border to several hundred feet in the valley center. Two key confining layers within the valley fill describe the aquifer system. At depth, a laterally contiguous and distinctive clay layer, referred to as the "blue clay," hydraulically separates the Upper Aquifer (UA) from the Lower Aquifer (LA), where present. Within the UA, a second clay layer, referred to as the "brown clay," hydraulically divides the UA into a shallow zone and a deep zone, where present. The occurrence of these layers as they are currently interpreted is illustrated on Figure 1-2, and more detailed descriptions of their thickness and composition are provided in other reports including the September 1, 2011 Technical Report – Response to Investigation Order No. R6V-2011-0043, Delineation of Chromium in the Upper Aquifer (Stantec 2011c); the October 30, 2013 Compliance with Provision 1.C. of Cleanup and Abatement Order No. R6V-2008-0002A4 and Requirements of Investigation Order No. R6V-2013-0029 (Stantec 2013); and the Updated Conceptual Site Model

and Background Chromium Concentrations for Lower Aquifer Report (Lower Aquifer CSM Report; Arcadis 2016b).

Following these divisions, wells are classified according to the criteria below for purposes of monitoring and reporting:

- South and North Hinkley Valley Areas:
 - The UA includes saturated deposits between the water table and the blue clay confining layer (where present) or to bedrock where the blue clay is not present. Where the blue clay is not present or is only intermittently present, weathered bedrock is considered part of the UA (Arcadis 2016b). The brown clay further divides the UA as follows:
 - The shallow zone of the UA includes saturated deposits between the water table and the brown clay. As shown on Figure 1-2, the brown clay is not present in much of South Hinkley Valley. In this area, wells screened within the uppermost 15 to 30 feet of the UA are generally classified to be in the shallow zone.
 - The deep zone of the UA includes saturated deposits between the base of the brown clay and the top of the blue clay (where present) or bedrock where the blue clay is not present. As shown on Figure 1-2, the brown clay is not present in much of South Hinkley Valley. In this area, wells screened deeper than 15 to 30 feet below the UA water table are generally classified to be in the deep zone.
 - The LA includes saturated material below the blue clay including weathered bedrock material. The LA is not present in the western portion of South Hinkley Valley, as depth to bedrock shallows and the aquifer system thins. Where the blue clay is absent, all saturated materials are considered part of the UA. The blue clay becomes thin and sandy in a transitional portion along its western boundary, where the LA is in hydraulic communication with the UA. This transitional area is described in detail in the Lower Aquifer CSM Report (Arcadis 2016b).
- Water Valley: No hydrostratigraphic divisions are included in this area at present; all saturated material is considered part of the UA regardless of depth.

Well designations used during the groundwater investigations and monitoring well installation over time are summarized in Appendix A, Table A-1. The initial groundwater well installation projects conducted in South Hinkley Valley generally used letter designations “A” and “B” in the well number identifications to distinguish between the shallow and deep zones of the UA. Wells completed in the LA were distinguished with the designation “C” in the well number. In 2007, as part of the expanded drilling for the IRZ monitoring and plume delineation programs, groundwater monitoring wells installed in the UA were assigned the letters “S” and “D” to distinguish shallow from deeper screened monitoring intervals. Where the UA is substantially thick, multiple wells have been installed and designated “A1,” “A2,” or “B1” and “B2” (pre-2008) and “S1,” “S2,” “S3,” “D1,” and “D2” to distinguish monitoring depths within a given zone. Appendix A presents a detailed summary of the well designations by investigation and/or installation phase.

Note that some wells were thought to be included in one zone of the UA at the time of installation, and therefore were appended with “A,” “B,” “S,” or “D.” These wells have been reclassified based on further review and/or due to declining groundwater levels, which have varied more than 20 feet from the 1990s to present. When this occurs, the well is not renamed to reflect the appropriate zone but is presented in the appropriate zone on the figures included herein.

In some cases, wells have been replaced for various reasons such as declining performance, becoming dry due to dropping groundwater levels, or location conflicts. In these cases, the replacement well was given the same name as the original and appended with an “R” for “replacement” through Fourth Quarter 2018. Since 2011, groundwater levels have declined up to 20 feet at many locations in the southern plume area, and groundwater levels are reaching historically recorded low points. Therefore, beginning in First Quarter 2019, the shallow wells that have gone dry are being replaced with an “M” designation for a mid-depth well screened between the shallow and deep wells. This accounts for the likelihood that groundwater levels will eventually rebound such that the original “S” zone wells will become saturated again, and the “M” designated well will be a mid-depth well.

1.2 Groundwater Remediation Program

PG&E is implementing several remediation projects for groundwater chromium treatment at the site including operating ATUs in the northern and southern portions of the chromium plume area and operation of three IRZs within the plume core. Additional remedial activities include groundwater extraction and freshwater injection in the northwest area. The IRZs operate under a Notice of Applicability (NOA) issued April 20, 2016 (2016 NOA; Water Board 2016) under the General WDRs. On March 12, 2014, the Water Board adopted the ATU WDRs (Board Order No. R6V-2014-0023). These provided requirements for continued operation of the former Desert View Dairy Land Treatment Unit as an ATU, provided for continued operation of existing ATUs, and outlined provisions for constructing and operating new ATUs (Water Board 2014). The monitoring and reporting requirements for these remediation projects are separate from those associated with the GMP; however, the chromium sampling data collected for monitoring of these other remedial activities are also reviewed as part of the GMP evaluation.

1.3 Domestic Well Sampling Program

PG&E has been collecting groundwater samples from domestic and other community wells at the site as directed by the Water Board or voluntarily in response to owner requests. In Second Quarter 2021, domestic wells were sampled in accordance with the 2015 CAO. The 2015 CAO states that all active domestic/community wells within the CAO Monitoring and Reporting Program used during the quarter or planned for use within the next 6 months should be sampled with the following exceptions:

- Domestic/community wells located in the Northern Disputed Plume Area and within 0.5 mile downgradient or cross-gradient from any northern area monitoring well should be sampled at the following frequencies:
 - Quarterly sampling at all domestic and community wells 0.5 mile downgradient or cross-gradient from a monitoring well exhibiting Cr(VI) or total chromium (Cr[T]) detections at or above drinking water standards (Cr[VI] greater than 10 µg/L, as of the date the 2015 CAO was issued) following any sampling event
 - Semiannual sampling in the Second and Fourth Quarters of each year at all domestic and community wells 0.5 mile downgradient or cross-gradient from a monitoring well exhibiting Cr(VI) or Cr(T) detections at or above the interim maximum background levels of 3.1 or 3.2 µg/L, respectively.
- No monitoring or domestic well sampling is required for the following locations:
 - Southwest (upgradient) of the Lockhart Fault
 - On or east of Dixie Road.

Domestic supply well monitoring in the southern plume area is required as part of Board Order R6V-2014-0023 (Water Board 2014).

Domestic supply wells were also monitored in accordance with the 2016 NOA (Water Board 2016) in Second Quarter 2021. Section 4.3 presents the results of domestic well sampling conducted by PG&E during Second Quarter 2021 (April through June), either in response to owner requests or in compliance with the 2015 CAO.

1.3.1 Domestic Well Nomenclature and Locations

Well nomenclature presented herein reflects PG&E's organization of the wells for reporting purposes and does not represent the well numbering system or well identifications assigned by the California Department of Water Resources. In general, domestic wells are named with the format "XX-XX." The first set of numbers represents the appropriate section defined by the United States System of Surveying the Public Lands. The second set of numbers represents the sequential order in which the well was incorporated into PG&E's database. As the study area has expanded into adjoining townships, sections have been duplicated, and a letter has been added to the end of the first two numbers signifying a different section. An example of this would be domestic well 16N-01 in Water Valley. A Section 16 nomenclature was already in use southeast of the site, and the "N" was added to denote a new northern section 16. Following the logic above, this is the first well of the section, and therefore ends in "01."

In addition, some wells are named as "BGS-XX." These wells were sampled as part of the Groundwater Background Study Report, Hinkley Compressor Station, Hinkley, California (CH2M HILL, Inc. [CH2M] 2007) and pre-date implementation of the domestic sampling programs presented herein. The "BGS" stands for "background study."

Finally, the accuracy of the depicted domestic well locations varies throughout the site and does not always represent a coordinate obtained from a California-licensed Land Surveyor. For wells where the location is not confirmed by a licensed surveyor, a handheld global positioning system unit, or placement based on field reconnaissance, the center of the parcel is used as a default. These procedures should be considered when reviewing domestic wells, especially those located on large parcels, and when wells are used to delineate chromium concentrations such as those shown on Figures 5-4, 5-5, and 5-6.

2 Second Quarter 2021 Monitoring Activities

This section describes the groundwater monitoring conducted for the site-wide GMP and DWSP during Second Quarter 2021. Results of sampling performed for both programs are presented in Section 4.

2.1 Groundwater Monitoring Program

The Second Quarter 2021 GMP monitoring event was conducted from April through June 2021. A total of 361 groundwater monitoring wells, extraction wells, and selected water supply wells were sampled during this event. The well locations are shown on Figure 2-1. The wells were sampled in accordance with the methods and procedures established for the site-wide GMP. Appendix B includes the sampling procedures, Appendix C lists the field water quality parameters measured during groundwater sampling, and Appendix D lists groundwater level measurements recorded for this event.

Monitoring wells listed in Table 2-1 comprise all monitoring programs including wells beyond those required to be sampled under the site-wide GMP that could not be sampled for various reasons during Second Quarter 2021. Monitoring wells monitored for IRZ system operations are discussed in further detail in the In Situ Reactive Zone (IRZ) report (Arcadis 2021d). Groundwater samples could not be collected from 37 UA monitoring wells that are required to be sampled by PG&E under various Orders due to insufficient water in the wells for groundwater purging and sample collection. Existing monitoring well MW-132S was not sampled previously due to the presence of desert tortoise habitat. Well MW-132S can now be accessed, as the necessary biological permits have recently been approved, but it remains in an area that is likely to contain desert tortoises. As discussed with the Water Board staff at a December 9, 2020 meeting, there are ample monitoring locations south of MW-132S that limit the benefit of mobilizing a development rig to access this remote location; therefore, development and sampling of well MW-132S will be considered once the USGS background study report has been released and reviewed. The USGS background study report is anticipated to be released in the first half of 2022. PG&E will continue to provide updates in future GMP reports. Additionally, access has been denied to the privately owned parcel containing monitoring well MW-54.

The laboratory analytical data were reviewed and validated to assess data quality and identify deviations from analytical requirements. All reported analytical data collected during this monitoring period are considered usable for the intended purposes of monitoring groundwater conditions.

2.2 Domestic Well Sampling Program

2.2.1 Domestic Well Sampling

During this reporting period, 31 domestic and other private supply wells were sampled in response to the 2015 CAO sampling requirements (all domestic wells sampled were within the DWSP area; semiannual sampling is required for the Water Valley study area). Figure 2-1 shows the locations of the domestic and other private supply wells, the DWSP area (which was generated using the Environmental Impact Report Mitigation Measure chromium monitoring boundary [WTR-MM-2a; Water Board 2014]), and the Northern Disputed Plume Area for domestic well sampling. Tables 2-2 and 2-3 list the domestic wells that were and were not sampled during this

quarter, respectively. The analytical results from this reporting period are discussed in Section 4.3. Appendix B presents the methods and procedures for sample collection at the domestic and other supply wells.

2.2.2 Removal from Sampling Program and Destruction of Domestic Wells

The 2015 CAO details the requirements that must be met to remove an inactive domestic well from the DWSP under Monitoring and Reporting Program requirement V.B. Tables 2-4 and 2-5 list the inactive domestic wells on PG&E property that have been removed from the DWSP and secured in place. When a property is in escrow or purchased by PG&E, the property is surveyed including reconnaissance of domestic wells on the property. In general, domestic wells that do not appear to be secured during the property inspection are secured with a compression cap or other means (such as a steel plate).

Destruction of domestic wells on PG&E property was previously focused on wells screened across multiple water-bearing zones (the UA and LA). Per Water Board approval (Water Board 2017b), current and future well destruction will also include the destruction of selected inactive supply wells that are not screened across multiple water-bearing zones. Well screen information is first identified by reviewing information in the PG&E site database. A video camera is used to obtain well construction information when it is found to be incomplete. The resulting body of well construction information is used to evaluate whether a domestic well is screened across both aquifers and to determine how best to accomplish well destruction. Per the Water Board's requirement in the 2015 CAO Monitoring and Reporting Program Section V., PG&E will provide the Water Board with a list of inactive domestic wells that it plans to destroy at least 14 days before initiating destruction. PG&E has submitted the following notifications to date:

- Notification for Abandonment of 37 Inactive Domestic Wells Screened Across the Upper and Lower Aquifers (Phase 1), dated November 5, 2013 (PG&E 2013)
- Notification for Abandonment of 21 Inactive Domestic and Agricultural Supply Wells Screened Across the Upper and Lower Aquifers (Phase 2), dated October 23, 2014 (PG&E 2014)
- Notification for Abandonment of 23 Inactive Domestic Wells Screened Across the Upper and Lower Aquifers (Phase 3), dated June 15, 2015 (PG&E 2015a)
- Notification for Abandonment of 16 Inactive Domestic and Agricultural Supply Wells Screened Across the Upper and Lower Aquifers (Phase 4), dated October 30, 2015 (PG&E 2015b)
- Notification for Abandonment of 13 Inactive Domestic and Agricultural Supply Wells Screened Across the Upper and Lower Aquifers (Phase 5), dated March 9, 2016 (PG&E 2016)
- Continued Management of Inactive Supply Wells on Property Owned by Pacific Gas and Electric Company in Hinkley, California (PG&E 2017a)
- Continued Management of Inactive Supply Wells on Property Owned by Pacific Gas and Electric Company in Hinkley, California (PG&E 2017b)
- Request to Abandon Undocumented Domestic Supply Well (PG&E 2017c).
- Continued Management of Inactive Supply Wells on Property Owned by Pacific Gas and Electric Company in Hinkley, California (PG&E 2017d)

- Continued Management of Inactive Supply Wells on Property Owned by Pacific Gas and Electric Company in Hinkley, California (PG&E 2017e)
- Continued Management of Inactive Supply Wells on Property Owned by Pacific Gas and Electric Company in Hinkley, California (PG&E 2018a)
- Continued Management of Inactive Supply Wells on Property Owned by Pacific Gas and Electric Company in Hinkley, California (PG&E 2018b).
- Continued Management of Inactive Supply Wells on Property Owned by Pacific Gas and Electric Company in Hinkley, California (PG&E 2019).

PG&E did not destroy any domestic or agricultural supply wells during Second Quarter 2021 (Table 2-6).

2.2.3 Replacement Water Supply

The 2015 CAO requires that PG&E supply interim, uninterrupted replacement water (i.e., bottled water or equivalent) and then long-term replacement water to users of affected wells. Affected wells are active domestic or community wells containing chromium, linked to PG&E's historical releases, with Cr(VI) concentrations above 10 µg/L. All levels of Cr(VI) in domestic wells in use by Hinkley residents and sampled by PG&E are below 10 µg/L (see Section 4.3). Bottled water and long-term replacement water programs are currently not in effect due to Cr(VI) detections.

3 Second Quarter 2021 Groundwater Elevation and Flow

This section summarizes hydrogeologic conditions beneath the site including groundwater elevation, flow direction, velocity, and applicable horizontal gradient magnitudes. As described in Section 1.1.2, the aquifer system beneath the site is divided into the UA and LA by a confining clay layer referred to as the blue clay. The UA is further divided into a shallow zone and a deep zone by a second confining clay layer known as the brown clay. Where the brown clay is absent, the uppermost 15 to 30 feet of the UA is generally considered to be in the shallow zone, and deeper portions are considered part of the deep zone for the purposes of reporting.

Groundwater levels have dropped more than 20 feet at many wells since 2011 due to regional drought conditions, reducing the thickness of the UA. Therefore, some wells previously considered as shallow-zone monitoring wells have gone dry. The deeper screened monitoring wells at these locations are now more representative of shallow-zone conditions. Well data presented on figures in this report reflect these changing groundwater conditions where applicable. In some cases, where the aquifer is thin (less than 30 feet thick) and the brown clay is not present, the same monitoring wells may be presented on both shallow- and deep-zone maps to provide a more complete depiction of groundwater flow. The locations of these and other hydrogeologic features that affect the flow of groundwater beneath the site (such as faults) are shown on Figure 1-2.

Hydrogeologic information specific to these zones is described below and presented on the following four figures:

- Figure 3-1 presents groundwater elevations and flow contours in the shallow zone of the UA in South Hinkley Valley.
- Figure 3-2 presents groundwater elevations and flow contours in the deep zone of the UA in South Hinkley Valley.
- Figure 3-3 presents groundwater elevations and flow contours in the UA in North Hinkley Valley and the available groundwater flow information for Water Valley.
- Figure 3-4 presents groundwater elevations and flow contours in the LA and bedrock.

Although the 2015 CAO Monitoring and Reporting Program does not require the development of figures for the shallow and deep zones of the UA in this report, they are provided herein for technical accuracy. As discussed in Section 1.2, PG&E is implementing several remediation projects for groundwater chromium treatment including freshwater injection, groundwater extraction and irrigation of extracted water at ATUs, and IRZ operation. The monitoring and reporting requirements for these remediation projects are separate from those associated with the GMP, but their operation has significant impacts on the movement of groundwater throughout South Hinkley Valley. Details of these operations are reported in recurring submittals that document UA groundwater capture efforts and quarterly reporting of remedial operations and effectiveness. The most recent quarterly reports include the following:

- Second Quarter 2021 Hydraulic Capture Monitoring Report, dated July 15, 2021 (Arcadis 2021c)
- Second Quarter 2021 Monitoring Report for the In Situ Reactive Zone and the Northwest Freshwater Injection Projects, dated July 30, 2021 (Arcadis 2021d)
- Second Quarter 2021 Agricultural Treatment Units Monitoring Report, to be submitted by August 20, 2021 (Arcadis, in progress).

The above mentioned submittals contain details about groundwater flow specific to the areas and zones reported therein. This section provides a broader site-wide review of groundwater flow conditions.

3.1 Upper Aquifer—South Hinkley Valley

UA groundwater elevation contours and interpreted flow direction arrows for South Hinkley Valley are presented on Figures 3-1 and 3-2. Groundwater generally flows northward across South Hinkley Valley in both the shallow and deep zones and under a comparable groundwater gradient. The interpreted groundwater flow directions and calculated hydraulic gradients during this reporting period were comparable to those documented in the previous reporting period. In the shallow zone of the UA, groundwater to the east of the plume generally flows northwest under an average hydraulic gradient of 0.0031 foot/foot. Groundwater to the west of the plume generally flows northeast under an average hydraulic gradient of 0.0033 foot/foot, with an overall northward trend from the Mojave River. The groundwater flow direction in the deep zone of the UA is comparable to that in the shallow zone of the UA. Effects of PG&E's remediation projects can be seen throughout South Hinkley Valley, as groundwater is recirculated in the IRZs (southern portion of the figures), localized groundwater mounding is produced by freshwater injection in the west, and northward flow is captured by extraction south of Thompson Road.

These groundwater contours are shown at 5-foot intervals (except for a portion of the west, where 1-foot contours are shown for the shallow zone of the UA) to provide an overview of groundwater flow through the South Hinkley Valley. This contouring confirms continued achievement of hydraulic capture of chromium in groundwater in South Hinkley Valley. These capture zones are shown on Figures 3-1 and 3-2 as dashed dark blue lines.

Depth to groundwater in the UA in South Hinkley Valley currently ranges from approximately 61 to 114 feet below grade, with some variability directly adjacent to remedial activities such as pumping or injection. This is consistent with the depth to groundwater documented in the previous quarter. However, groundwater levels within the remediation area and regionally have demonstrated an overall downward trend in response to ongoing drought conditions. The Mojave River (which is the primary source of recharge to the Hinkley Valley) did not flow from 2012 through 2018, or in 2020. A single, short-duration, low-volume flow event occurred in the First Quarter of 2019 (February 16, 2019); however, little to no recharge has been observed. The last major flow events occurred during the winters of 2004/2005 and 2010/2011 (USGS 2021).

To develop a greater understanding of groundwater flow east and southeast of the compressor station under the current drought conditions, four multiple-depth piezometers (PZ-16A/B through PZ-19A/B) were constructed and developed in the Third and Fourth Quarters of 2018. Groundwater elevation contours include these monitoring data semi-annually (First and Third Quarters). As shown on Figures 3-1 and 3-2, potentiometric contours indicate that a capture zone (interpreted as dark blue dashed line) east of Summerset Road has formed from the operation of extraction wells along the eastern margin of the chromium plume (orange well symbols) including five extraction wells (EX-55, EX-56, EX-59, EX-60, and EX-61, which began operating in the summer of 2018) and existing extraction wells (orange well symbols in both depth intervals). Two additional extraction wells (EX-66 and EX-67) were brought online east of the compressor station and south of Community Boulevard in April 2019. These wells are further enhancing inward gradients along the eastern chromium plume margin. Additionally, a new extraction well (EX-68) was brought online early in the Second Quarter of 2021 north of the Community ATU to further enhance inward gradients. The available groundwater elevation data indicate that groundwater bearing Cr(VI) at the southeastern boundary of the chromium plume may locally flow northeasterly near the Cr(VI) plume

outline, but that overall groundwater flow then returns to a north-to-northwest flow direction and is captured at the extraction wells along Summerset Road and in the vicinity of the Community East ATU.

3.2 Upper Aquifer—North Hinkley Valley and Water Valley

UA groundwater elevation contours and flow direction arrows for North Hinkley Valley are presented on Figure 3-3. Groundwater flow in North Hinkley Valley continues the northward flow of the South Hinkley Valley under an average hydraulic gradient of 0.0014 foot/foot. Depth to groundwater in North Hinkley Valley ranges from approximately 53 to 101 feet below grade. Groundwater flow from North Hinkley Valley to Water Valley occurs through Hinkley Gap (Figure 1-2), a narrowing at the northern end of Hinkley Valley at Red Hill (Figure 3-3). Northward flow through Hinkley Gap is interpreted to primarily occur on the western side of Red Hill through an ancestral Mojave River channel at a rate of approximately 1,000 gallons per minute (Aquifer Science and Technology 2007). PG&E interprets flow on the western side of Red Hill to occur below the brown clay and in the deep zone of the UA (Stantec 2013). Groundwater flow north of Red Hill through the Water Valley continues northward under an average hydraulic gradient of 0.0024 foot/foot.

3.3 Lower Aquifer

Regional groundwater flow in the LA and weathered bedrock generally follows the trend of the UA as shown on Figures 3-1 and 3-2. Based on the analysis presented in the Lower Aquifer CSM Report (Arcadis 2016b), the blue clay aquitard forming the LA is not interpreted to become a confining unit east of the blue shaded area shown on Figure 3-4. The 2016 interpretation contrasts with previous reports, indicating that the LA began east of the dashed brown line, depicting the western occurrence of the blue clay. Within the blue shaded area, the LA sediments are in hydraulic communication with the UA and are now considered part of the UA. This is because the blue clay becomes thin, discontinuous, and sandy in a transitional portion along its western boundary. This transitional area, where the LA is in hydraulic communication with the UA, is shown as a blue shaded area on Figure 3-4. An average hydraulic gradient of approximately 0.0021 foot/foot was calculated in the area monitored.

3.4 Groundwater Gradient and Velocity

Groundwater gradients and estimates of groundwater velocity for the UA and LA are posted, as appropriate, on Figures 3-1 through 3-4. Velocity calculations are based largely on the assumptions of hydraulic conductivity (K) used in PG&E's groundwater flow model. The reliability of K values in this model (and therefore, the reliability of these velocity calculations) depends on the available dataset for each portion of the site. Estimates of K used in the model are derived from this available dataset. The significant number of wells and substantial extraction being performed in the central portion of South Hinkley Valley have resulted in a large dataset from which to obtain reliable K values. By contrast, little pumping test data have been collected for the western portion of the South Hinkley, North Hinkley, and Water Valleys due to the absence of remedial extraction. Calculations for groundwater velocity in these areas are, therefore, less precise. In addition, the current model domain does not extend into Water Valley, and aquifer parameters have been estimated from other information. PG&E has been updating the groundwater flow model, including expanding the model domain into Water Valley, to support the USGS' chromium background study. The K values in the updated flow model will be incorporated into groundwater velocity estimates when this work is completed.

Hydraulic conductivity is estimated to be much lower in the finer-grained western portion of South Hinkley Valley than in the comparatively coarser-grained central and eastern portions. North Hinkley Valley is also estimated to exhibit relatively lower hydraulic conductivity due to the presence of more fine-grained sediments.

Previous modeling, tracer, and remedial system pumping tests indicate that maximum groundwater velocities in the south central Hinkley Valley generally range from 1 to 4 feet per day (Haley & Aldrich 2010; Arcadis 2016b). The velocities shown on Figures 3-1 and 3-2 are generally consistent with these findings. As noted above, the presence of finer-grained sediments in the North Hinkley Valley, Water Valley, and the upper portion of the western South Hinkley Valley suggests that groundwater moves slower than the 1 to 4 feet per day estimates for the South Hinkley Valley within PG&E's remediation area.

4 Second Quarter 2021 Monitoring Results

This section presents the results of the GMP and DWSP chromium sampling conducted during the Second Quarter 2021 reporting period. Groundwater samples were analyzed for Cr(VI) and/or Cr(T) using United States Environmental Protection Agency Methods SW 218.6/3500-Cr and SW 6010B/6020A, respectively. Table E-1 in Appendix E includes a database report of the chromium results from 2001 through March 2021 for wells sampled as part of the GMP. Samples collected from selected monitoring wells were also analyzed for other water quality parameters. Appendix F includes laboratory analytical reports and chain of custody records for the groundwater samples collected during Second Quarter 2021.

4.1 Upper Aquifer

Table 4-1 presents Third Quarter 2020 through Second Quarter 2021 Cr(VI) and Cr(T) analytical results for the site-wide GMP groundwater monitoring, extraction, and selected water supply wells. In addition, Table 4-1 lists the historical maximum Cr(VI) and Cr(T) results for each well. Table 4-2 lists the initial and resampling results for wells that required resampling under the 2015 CAO and additional GMP wells resampled during the quarter for other reasons.

The 2015 CAO requires that wells be resampled during the same quarter and analytical results presented within the same quarter under the following conditions:

- If sample results show a relative percent difference of 25 percent or greater between Cr(VI) and Cr(T) concentrations, and if both concentrations are less than 10 µg/L, Cr(VI) is greater than 3.1 µg/L, and Cr(T) is greater than 3.2 µg/L
- If sample results exhibit a Cr(VI)/Cr(T) difference greater than 1.0 µg/L at concentrations below 4 µg/L.

During Second Quarter 2021, 12 wells exhibited Cr(VI)/Cr(T) differences greater than 1.0 µg/L, and four wells exhibited greater than 25 percent relative percent difference. These monitoring wells were resampled per the requirements in the 2015 CAO. Additionally, seven wells were resampled for other reasons, primarily to confirm concentration changes. The resample results are presented in Table 4-2.

4.1.1 Evaluation of Chromium Concentrations in “Western Finger” and Western Plume Area

In accordance with the 2015 CAO, there are 15 sentry wells in the general area west of Serra Road, between Barstow-Bakersfield Highway and Acacia Street, used as sentry wells for the “western finger.” If concentrations in any of the sentry wells meet or exceed 10 µg/L for two consecutive quarters, a report documenting proposed remedial actions for the observed exceedances is required. None of the sentry wells sampled yielded concentrations greater than 10 µg/L during Second Quarter 2021.

In addition, in accordance with the Contingency Plan for Proposed Modifications to the Action Plan for the Western Area (Arcadis 2017d), PG&E monitors four monitoring wells east of the Northwest Freshwater Injection (NWF) system. Monitoring wells MW-29, MW-45A, MW-47, and MW-101D are monitored for Cr(VI) and Cr(T) in accordance with the sampling frequency in the 2015 CAO to confirm that Cr(VI) and Cr(T) concentrations are not increasing above the interim maximum background values. Cr(VI) concentrations at wells MW-29, MW-45A, and

MW-47, sampled Second Quarter 2021, remained below the interim maximum background concentration of 3.1 µg/L at that time.

Cr(VI) concentrations at monitoring well MW-101D have consistently been greater than 3.1 µg/L since it was first sampled in June 2011. The Cr(VI) concentration at MW-101D was 3.7 µg/L in the Fourth Quarter of 2017 when the contingency plan was written. Cr(VI) was reported at a concentration of 3.8 µg/L during Second Quarter 2021. Since 2017, hydraulic containment has been consistently demonstrated by an inward gradient calculated between outboard well MW-101D and inboard MW-109 (Arcadis 2021c). Therefore, the concentrations above the interim maximum background values at MW-101D are not attributable to changes associated with western area extraction operations. It is estimated that the concentrations reported for this well reflect migration of existing mass in the vicinity of this well being drawn easterly into the pumping center, as there are generally decreasing trends at other monitoring wells in this area. Contingency actions, such as increasing flow rates at the currently operated extraction wells, will be taken if Cr(VI) is detected at concentrations greater than 10 µg/L in accordance with the Revised Recommendations for Alternative Capture Metrics (Arcadis 2016c).

4.1.2 Evaluation of Chromium Concentrations in “Northern Disputed Plume Area”

The 2015 CAO also requires evaluation of monitoring results from the Northern Disputed Plume Area for the identification of “hot spots.” Cr(VI) concentrations requiring preparation of a work plan to address Cr(VI) concentrations in groundwater are defined in the Section VI.C.2 (a) of the 2015 CAO as:

- i. “any domestic well having Cr(VI) equal to or exceeding 10 µg/L during any one sampling event; or
- ii. any monitoring, extraction, remediation well or piezometer having hexavalent chromium concentrations greater than 10 µg/L within one half mile upgradient of any active domestic well and meeting any of the following conditions (triggers):
 1. Fifty percent or more increase above Cr(VI) concentrations reported in second quarter 2015 that persist for two consecutive sampling events;
 2. Increasing statistical trend (using Mann-Kendall) over four sampling events.”

No monitoring wells in the Northern Disputed Plume Area met the 2015 CAO “hot spot” criteria in Second Quarter 2021. Cr(VI) and Cr(T) concentrations at monitoring well MW-137S3 previously exceeded 10 µg/L beginning in Fourth Quarter 2019. Due to concentrations exceeding 10 µg/L from Fourth Quarter 2019 through First Quarter 2021, a 10 µg/L contour was drawn around this well. However, because the Cr(VI) and Cr(T) concentrations at monitoring well MW-137S3 did not exceed 10 µg/L during Second Quarter 2021, the 10 µg/L contour was removed. Monitoring will continue per the 2015 CAO to confirm that concentrations remain below 10 µg/L at MW-137S3. Well MW-137S3 will be sampled next during the Third Quarter 2021 sampling event.

4.2 Lower Aquifer

Tables 4-1 and 4-3 include the chromium results for groundwater monitoring and private supply wells completed in the LA and bedrock, respectively. Sixteen LA and bedrock wells in the site-wide GMP were sampled during Second Quarter 2021. Previously, Cr(VI) and/or Cr(T) concentrations have been detected at or above 3.1 and 3.2 µg/L, respectively, in five monitoring wells (MW-23C, MW-28C, MW-42C, MW-92C, and MW-100C). Since 2016

or 2017, Cr(VI) concentrations have been less than 3 µg/L at LA monitoring wells MW-23C (October 2017), MW-28C (July 2016), and MW-42C (June 2017).

Consistent with past results, monitoring wells MW-92C and MW-100C continue to exhibit Cr(VI) and Cr(T) results exceeding 3.1 and 3.2 µg/L, respectively. The Second Quarter 2021 Cr(VI) concentration at MW-92C (25 µg/L) shows a decrease since April 2015 (27 µg/L; Appendix E); however, the concentration trend at this well has generally been stable during the last 6 years of monitoring. The Second Quarter 2021 Cr(VI) concentration at MW-100C (18 µg/L) is also unchanged from recent (Second Quarter 2020 through First Quarter 2021) monitoring events. The Second Quarter 2021 Cr(VI) concentration is lower than that from January 2015 (19 µg/L), but concentrations continue to be greater than the lowest concentration of 9.2 µg/L reported for the well in July 2017. Mass previously at MW-23C (located within the LA with a historical high concentration of 23.8 µg/L in November 2011) and MW-42C (also in the LA with 15.4 µg/L in August 2011) may be slowly migrating towards MW-92C and MW-100C (located in the transitional clay area, Figure 3-4), where it is expected to be drawn into UA extraction wells.

Chromium concentrations at MW-92C and MW-100C were anticipated to decrease as mass in this area is drawn into UA extraction wells and/or reduced as lower concentration groundwater from the MW-23C and MW-42C area migrates towards these wells. Chromium concentrations at both MW-92C and MW-100C were also expected to decline as the UA groundwater in this area continues to show declining chromium concentrations to below 10 µg/L at many UA monitoring wells (Figure 5-2). However, the stagnating trends at wells MW-92C and MW-100C suggest that changes to remedial pumping wells may be needed to improve concentration trends.

Operation of extraction wells EX-29 and EX-37 (and perhaps EX-30) may have impeded further concentration reductions at MW-92C and MW-100C, as these extraction wells were thought to potentially be creating localized capture zones that were reducing the overall clean water flushing rate towards the larger capture zone further east (IW-01 and IW-02). Therefore, on January 9, 2020, PG&E submitted an email (PG&E 2020a) to the Water Board requesting approval to conduct an 18-month pilot test involving turning EX-29, EX-30, and EX-37 off to assess if gradients and concentration reductions may be improved by changing the extraction well configuration in this area. At the request of the Water Board, response to comments letters were sent on February 14, 2020 and March 27, 2020 clarifying components of the pilot study (PG&E 2020b, 2020c). Approval to conduct the pilot test was received on May 12, 2020. The pilot test began in July 2020 when EX-29 and EX-37 (the two lowest producers of the three extraction wells) were shut off. EX-30 was also shut down in January 2021. When sufficient data have been obtained to assess the potential benefits of limited or no extraction from wells EX-29, EX-30, and/or EX-37, PG&E will summarize the findings and propose a longer-term strategy for addressing chromium concentrations at MW-92C and MW-100C.

As requested by the Water Board, rate information for the extraction wells and remedial actions conducted to date in the LA are being provided in the quarterly ATU monitoring reports. The Second Quarter 2020 Agricultural Treatment Units Monitoring Report containing this information will be submitted to the Water Board by August 20, 2021 (Arcadis, in progress).

4.3 Domestic Well Sampling

Table 4-3 presents the Cr(VI) and Cr(T) analytical results for the 31 domestic wells within the DWSP, other private supply wells sampled during this reporting period, and data from the previous three quarters. Domestic wells sampled in Second Quarter 2021 are shown on Figure 4-1. The laboratory analytical reports and chain-of-custody

records for the domestic and other supply wells sampled during the reporting period are included in Appendix F. Cr(VI) concentrations were detected above 3.1 µg/L and/or 3.2 µg/L, respectively, in two wells (23-30 and 28N-05) during Second Quarter 2021.

- PGE-owned well 23-30 is located south of Thompson Road, between Summerset and Mountain View Roads. Cr(VI) and Cr(T) concentrations in well 23-30 were 3.2 µg/L and 3.2 µg/L, respectively, during Second Quarter 2021.

Well 28N-05 is located in the northern portion of the DWSP area in Water Valley, west of Hinkley Road and south of Sunset Road (Halsted Road). Cr(VI) and Cr(T) concentrations in well 28N-05 were 3.4 µg/L and 3.1 µg/L, respectively, during the Second Quarter of 2021. Cr(VI) and Cr(T) concentrations in 28N-05 have been above 3.1 µg/L and 3.2 µg/L, respectively, since the well was first sampled in July 2012. Cr(VI) and/or Cr(T) concentrations were not detected above 3.1 and 3.2 µg/L, respectively, in any other domestic well located within the DWSP sampled during the Second Quarter of 2021. As required by the 2015 CAO, domestic well sampling results are used for contouring chromium in the Northern Disputed Plume Area where no monitoring well data are available within 0.5 mile of the domestic well. In addition, the 2015 CAO states the following sampling frequency:

- Quarterly sampling at all domestic and community wells 0.5 mile downgradient or cross-gradient from a monitoring well exhibiting Cr(VI) or Cr(T) detections at or above drinking water standards following any sampling event
- Semi-annual sampling in the Second and Fourth Quarters of each year at all domestic and community wells 0.5 mile downgradient or cross-gradient from a monitoring well exhibiting Cr(VI) or Cr(T) concentrations at or above the interim maximum background levels.

The Second Quarter 2021 analytical results from monitoring wells located 0.5 mile upgradient or cross-gradient from a domestic well in the Northern Disputed Plume Area indicated that chromium concentrations were below the former drinking water standard of 10 µg/L for Cr(VI) (as of the date on which the 2015 CAO was issued) and the current drinking water standard of 50 µg/L for Cr(T).

Domestic wells in the Northern Disputed Plume Area located 0.5 mile downgradient from a monitoring well that exhibits chromium concentrations above the interim maximum background levels in the previous two quarters will be sampled in Fourth Quarter 2021 pending permission from the owners.

4.4 Statistical Analysis of Domestic Well Analytical Results

The 2015 CAO requires analysis of whether any domestic well within the domestic well sampling area contains Cr(VI) at concentrations that demonstrate an increasing trend, indicating likely future exceedances of 10 µg/L Cr(VI) within 1 year. No wells require replacement water based on Second Quarter 2021 data and trends.

Because criteria and methodologies for determining an “increasing trend” were not specified in the 2015 CAO, PG&E is implementing Mann-Kendall statistical trend analysis of Cr(VI) data as an initial screening tool to identify increasing trends that may warrant additional evaluation. A statistical analysis of Cr(VI) data was performed for 31 domestic wells (Table 4-4) sampled in Second Quarter 2021 that had a total of eight or more sample results. Of the 31 wells analyzed, results for 24 wells indicate stable (no trend) to decreasing trends, and seven wells indicate increasing trends. Trend plots were prepared for the seven wells indicating increasing trends based on the Mann-Kendall statistical trend analysis. These are included in Appendix G. Based on review of these trend graphs, Cr(VI) concentrations at these domestic wells are not expected to increase above 10 µg/L in the next year or in the future. Quarterly monitoring of these wells will continue to confirm trends.

5 Occurrence and Distribution of Chromium in Groundwater

This section interprets and evaluates the sample results for the GMP and DWSP conducted following the requirements in the 2015 CAO during the Second Quarter 2021 reporting period. A brief summary of the chromium distribution is included in Section 5.1. The 2015 CAO requires a presentation of chromium isoconcentration contours based on physical and chemical characteristics, as interpreted from data reported from monitoring wells and extraction wells sampled in the quarter using best professional judgment. Section 5.2 provides a professional judgement discussion of the contoured chromium distribution in the UA, where isolated areas with chromium detections greater than the interim background concentrations were not connected to the contiguously mapped isoconcentration contours. Section 5.3 discusses the Northern Disputed Plume Area. Section 5.4 compares the current UA chromium distribution to that from the previous quarter.

5.1 Chromium Distribution in Upper and Lower Aquifers

The distribution of chromium in the UA was evaluated using the Second Quarter 2021 results in accordance with the methods specified in the 2015 CAO. Consistent with these methods, the chromium distribution figures prepared for the site-wide GMP use concentrations of 3.1 µg/L for Cr(VI) and 3.2 µg/L for Cr(T) for the outer boundary isoconcentration contour line. The extent of chromium is further delineated internally using 10, 50, and 1,000 µg/L isoconcentration contours for Cr(VI) and/or Cr(T). This information is presented on Figures 5-1 through 5-5, as described below. Contouring does not include domestic supply wells, except as described below.

Consistent with the 2015 CAO, chromium detections in the areas southwest of the projection of the Lockhart Fault, or on or east of Dixie Road, are not considered to be related to PG&E's historical operations. These areas are shown in gray on relevant figures, and concentrations therein are not evaluated for plume contouring.

Shallow and Deep Zones of the UA: Although not required by the 2015 CAO, Figures 5-1 and 5-2 present the chromium distribution specific to wells screened in the shallow or deep zones of the UA, respectively. These figures are provided to present the technical basis for the isoconcentration depiction portrayed on the composite UA map (Figure 5-5) and provide a more complete presentation of the occurrence of chromium in the UA at both depth zones. Zone-specific figures showing the chromium distribution in the area south of the Barstow-Bakersfield Highway are consistent with contours previously submitted in the Second Quarter 2021 Monitoring Report for the IRZ and NWFI Projects (Arcadis 2021d), where a more robust dataset was considered during contour development. Select wells from the IRZ monitoring program and the Second Quarter 2021 Cr(VI) and Cr(T) monitoring results are shown on Figures 5-1 and 5-2. Chromium figures from the Second Quarter 2021 Monitoring Report for the IRZ and NWFI Projects (Arcadis 2021d) are provided in Appendix H, showing the entire IRZ area dataset. Additionally, select monitoring wells with Cr(VI) and Cr(T) data from previous reporting periods were included on figures to support isoconcentration contour development in areas where the Second Quarter 2021 monitoring data were not collected per the Monitoring and Reporting Program.

LA: Figure 5-3 shows the chromium plume outlines for the LA. Chromium migration from the UA into the LA is believed to have occurred where the blue clay is not present (Stantec 2011a, 2011b) or in the transitional clay area, where it is thin and sandy (Stantec 2011b; Arcadis 2016b). The transitional clay area is depicted as a blue shaded area on Figure 5-3. Within the blue shaded transitional area on Figure 5-3, the blue clay does not act as

an aquitard, and the UA and LA groundwater are in hydraulic communication (Arcadis 2016b). Figure 5-3 also depicts an isoconcentration contour for 0.2 µg/L as required by the 2015 CAO.

Since early 2012, the vertical gradient in the LA east of the blue shaded area has been reversed (changed to upward) by essentially eliminating LA pumping in the area, initiating UA pumping at extraction wells EX-29 and EX-30, and increasing UA pumping throughout the greater area where the LA is impacted with chromium. PG&E also turned off UA extraction well EX-26 in January 2015 and began operation of an extraction well EX-37 in March 2015, which is screened across the UA and LA to further improve hydraulic containment of chromium in the LA. Extraction well EX-37 is located near monitoring well MW 92C, where the highest concentrations of Cr(VI) have historically been detected in the LA. The effectiveness of extraction well EX-37, other remedial actions taken to reduce chromium concentrations and recommendations for future actions to address chromium in the LA have been evaluated in the Annual Cleanup Status and Effectiveness Reports (Arcadis 2016a, 2017c, 2018c, 2019b, 2020c, 2021a) since 2015 and the Lower Aquifer CSM Report (Arcadis 2016b).

As shown on Figure 5-2 (depicting chromium concentrations in the deep zone of the UA), chromium concentrations at wells screened across the deep zone of the UA near Santa Fe Avenue and Mountain View Road (MW-28B, EX-29, and EX-30), where chromium is present at concentrations greater than 10 µg/L in the LA (Figure 5-3), have decreased to below 10 µg/L (Tables 4-1 and Table E-1). Lower chromium concentrations in these UA wells, located above the transitional blue clay area of the LA shown on Figure 5-3, indicate favorable conditions for concentrations at monitoring wells MW-92C and MW-100C (located within the blue shaded transitional area) to begin to decline. However, as detailed in Section 4.2, concentrations at MW-92C and MW-100C have declined since reaching their maximum values, but recent results show generally stable trends. Concentrations at these wells were expected to slowly decrease in the future as groundwater near these wells is drawn upward into UA extraction wells and/or deep-zone UA groundwater (less than 10 µg/L) mixes with LA groundwater in the transitional blue clay area containing LA monitoring wells MW-92C and MW-100C. As discussed in Section 4.2, a pilot test that involves turning off EX-29, EX-30, and EX-37 began in the Third Quarter of 2020 to assess if concentration trends at wells MW-92C and MW-100C may be improved by changing pumping operations to optimize hydraulic gradients in the vicinity of these wells (Arcadis 2020d).

Domestic Supply Wells: Figure 5-4 presents chromium results for domestic well sampling. In accordance with the 2015 CAO, a chromium isoconcentration contour for the domestic wells was not drawn, but the maximum isoconcentration contour for the 3.1/3.2 µg/L Cr(VI)/Cr(T) interval shown on Figure 5-5 is provided for reference. As noted in Section 1.3.1, the accuracy of the depicted domestic well locations varies throughout the site and does not always represent a coordinate obtained from a California-licensed Land Surveyor.

Maximum UA Extent: Figure 5-5 presents the maximum extents of the 3.1/3.2, 10, 50, and 1,000 µg/L isoconcentration contours for Cr(VI) and/or Cr(T), respectively, in both the shallow and deep zones of the UA as required by the 2015 CAO. The isoconcentration contours represent the maximum lateral extents, as defined by current monitoring points, but are not intended to imply that all areas within each isoconcentration contour exhibit concentrations above the respective concentration contoured. Many areas within the plume core exhibit concentrations below these respective concentrations, as can be seen in the Second Quarter 2021 Monitoring Report for the IRZ and NWFJ Projects (Appendix H).

Maximum extent isoconcentrations represent a combination of the zone-specific shallow- and deep-zone isoconcentration contours shown on Figures 5-1 and 5-2. As indicated, the maximum outline of the 3.1 and 3.2 µg/L chromium isoconcentration contour is dashed with question marks where it is approximated and cannot be accurately delineated using existing well data. Consistent with the 2015 CAO, private domestic wells in Water

Valley and north of Grasshopper Road with concentrations above 3.1 and 3.2 µg/L for Cr(VI) and Cr(T), respectively, are used for plume contouring when monitoring results are available. Private domestic wells in North and South Hinkley Valleys are not included in contour development.

The Second Quarter 2021 maximum extents of the 3.1/3.2, 10, 50, and 1,000 µg/L chromium isoconcentration contours for Cr(VI) and/or Cr(T) were generally comparable to those from First Quarter 2021. Changes from the First Quarter 2021 to the Second Quarter 2021 plume outlines are discussed in Sections 5.2 through 5.4.

The highest Cr(VI) concentration on site during the Second Quarter of 2021 was 3,900 µg/L, measured south of Community Boulevard in the northern Source Area IRZ at deep zone monitoring well SA-MW-10D. The recent elevated detections at SA-MW-10D are thought to be remnant Cr(VI) mass west of SA-MW-10D that migrated east due to the formation of easterly gradients when extraction wells EX-55, EX-56, and EX-67 began operation.

5.2 Best Professional Judgement Discussion of Isoconcentration Contours in Southern Plume Area

The 2015 CAO requires that chromium isoconcentration contour lines be drawn by a licensed Professional Geologist or Civil Engineer by evaluating and reporting the site-specific conditions using best professional judgement and considering the following factors at a minimum:

- Geology
- Hydrogeology
- Geochemistry
- Technical information released on the USGS background study of chromium concentrations.

Geology, hydrogeology, and geochemical conditions were considered in the development of isoconcentration contours presented on Figures 5-1 through 5-6. Domestic well data were also considered, and the differences between monitoring wells and supply wells were factored into the technical interpretation and explanation of the data. As of the date of this report, no technical information on the USGS background study was available for consideration to support professional judgement interpretation of isoconcentration contours. It should be noted that the 2015 CAO-required maximum UA extent isoconcentration map presented on Figure 5-5 does not acknowledge the complexity of the site, the appreciable thickness of the aquifer, or the changing hydrogeology throughout the significant size of the project area (see Figure 1-2). PG&E believes that the zone-specific figures (Figures 5-1 and 5-2) present a more accurate interpretation of the distribution of chromium, which is different for the shallow and deep UA zones shown on these figures. Areas where best professional judgement has been used are discussed below. Concentrations in the following monitoring wells exceed the interim background Cr(VI) and Cr(T) concentrations of 3.1 and 3.2 µg/L, respectively, and are disconnected from the contiguous 3.1/3.2 µg/L isoconcentration contour on Figures 5-1, 5-2, and 5-5:

In the eastern area between Alculdia and Thompson Roads east of the contiguous plume area, chromium concentrations in well MW-97S have been disconnected from the contiguous isoconcentration contour for the following reasons:

Second Quarter 2021 Groundwater Monitoring Report and Domestic Well Sampling Results

- Monitoring well MW-97S is screened across weathered bedrock and is located cross-gradient from the contiguous plume area. In the absence of sufficient groundwater extraction to locally draw the plume cross-gradient and considering the markedly unique geochemical signature at this well compared with other monitoring wells in the area, chromium detected in groundwater in this well should not be connected to the contiguous isoconcentration contour.
- During Second Quarter 2019, monitoring well MW-97S contained total dissolved solids (TDS) at 250 milligrams per liter (mg/L), whereas most wells west of this well (MW-79S, MW-84S, and others) contain TDS at concentrations exceeding 1,000 mg/L (Arcadis 2019c). Similarly, MW-97S contained TDS at a concentration of 270 mg/L during Fourth Quarter 2019 (Arcadis 2020a) and 240 mg/L during Fourth Quarter 2020 and Second Quarter 2021, while TDS concentrations exceeding 1,000 mg/L continued to be measured at wells west of MW-97S.
- In the Fourth Quarter of 2013, nitrate as nitrogen concentrations at monitoring well MW-97S were non-detect, whereas concentrations at monitoring wells MW-79S and MW-94S were 12.4 and 8.07 mg/L, respectively (CH2M 2014). The nitrate as nitrogen concentration at monitoring well MW-97S in Second Quarter 2020 continued to be low at 0.17 mg/L. These data illustrate that groundwater near monitoring well MW-97S originates from a different source than the groundwater in monitoring wells MW-79S, MW-84S, and MW-94S; therefore, the chromium isoconcentration contour should not be extended around monitoring well MW-97S.

In the area along and north of Thompson Road, chromium concentrations in wells MW-127S1, MW-206S, MW-105S have been disconnected from the contiguous isoconcentration contour as follows:

- The Cr(VI) and Cr(T) concentrations at MW-127S1 were 3.3 and 4.8 µg/L, respectively, which exceed the interim background thresholds. Because chromium data have consistently been above the thresholds since Fourth Quarter 2019 (Table 4-1, Table E-1), and wells located between MW-127S1 and the contiguous plume (MW-70S, MW-84S, MW-85S, and MW-89S) have consistently exhibited concentrations below these thresholds, MW-127S1 remains disconnected from the contiguous 3.1/3.2 µg/L isoconcentration contour.
- The Cr(VI) and Cr(T) concentrations at MW-206S were 3.9 and 6.4 µg/L, respectively, which exceeded the interim background thresholds. Because historical data fluctuate near contouring thresholds (Table 4-1), and wells located between MW-206S and the contiguous plume (MW-84S and G-1R) exhibit concentrations below these thresholds, MW-206S remains disconnected from the contiguous 3.1/3.2 µg/L isoconcentration contour.
- The Cr(VI) and the Cr(T) concentrations at MW-105S were 2.7 and 3.4 µg/L, respectively, which exceeded the interim background contouring threshold for Cr(T). Cr(VI) concentrations have never exceeded the interim background contouring threshold, while Cr(T) results have fluctuated over the contouring threshold over time. Consequently, and because well EX-32 (located between MW-105S and the contiguous plume) exhibited concentrations below the thresholds, MW-105S remains disconnected from the contiguous 3.1/3.2 µg/L isoconcentration contour.

In the area north of Thompson Road, Cr(VI) and Cr(T) concentrations at MW-128S1 were 8.9 and 9.0 µg/L, respectively during Second Quarter 2021 monitoring. Subsequently, the isolated 10 µg/L contour previously surrounding this well in First Quarter 2021 was removed. An isolated 10 µg/L chromium isoconcentration contour was initially added around MW-128S1 in Fourth Quarter of 2019 due to a detection of chromium greater than 10 µg/L. As part of the Contingency Plan for Chromium Detected at Monitoring Well MW-128S1 (Arcadis 2020b), the well was redeveloped, chromium concentrations decreased, and the isolated 10 µg/L contour was not present around this well in the First, Second, and Third Quarters 2020 (Arcadis 2021c). The chromium concentrations from the Fourth Quarter 2020 and First Quarter 2021 were again reported to be equal to 10 µg/L at well MW-

128S1. Therefore, contingency actions identified in the previously submitted contingency plan (Arcadis 2020b) were resumed in the Fourth Quarter of 2020 and continued through Second Quarter 2021. The contingency actions will continue until Cr(VI) concentrations at MW-128S1 remain less than 10 µg/L for two consecutive quarters. Additional details are summarized in the Second Quarter 2021 Hydraulic Capture Report (Arcadis 2021c).

In the area north of Barstow-Bakersfield Highway and east of the NWFI system, chromium concentrations at well MW-66A have been disconnected from the contiguous isoconcentration contour. The Cr(VI) and the Cr(T) concentrations at MW-66A were 3.0 and 3.3 µg/L, respectively, which exceeded the interim background contouring threshold for Cr(T). Because chromium concentrations historically fluctuate near contouring thresholds (Table 4-1 and Table E-1), and wells located between MW-66A and the contiguous plume (MW-45A, EX-20, and MW-108D) exhibit concentrations below these thresholds, MW-66A was not connected to the contiguous 3.1/3.2 µg/L isoconcentration contour.

In the area north of Alcudia Road and east of Mountain View Road, chromium concentrations in well MW-83S have been disconnected from the contiguous isoconcentration contour as follows:

- The Cr(VI) and the Cr(T) concentrations at MW-83S were 4.9 and 5.7 µg/L, which exceed the interim background contouring thresholds of 3.1 µg/L and 3.2 µg/L, respectively. Chromium results for well MW-83S have exceeded both the Cr(VI) and the Cr(T) interim background contouring thresholds since First Quarter 2019. However, Cr(VI) concentration data for numerous wells south and east of this well continue to be below the contouring thresholds (DW-03, MW-68S, and MW-170S). Therefore, well MW-83S was not connected to the contiguous 3.1/3.2 µg/L isoconcentration contour.

At the NWFI system, near Serra Road and the Barstow-Bakersfield Highway, freshwater sourced from southeast of the chromium plume is continuously injected in up to six wells. PG&E has been operating the NWFI system since March 2010 to provide a freshwater mounding effect in this area and to prevent potential westward migration of the chromium plume. Current east-to-northeast groundwater flow in this area is shown on Figure 3-1 at 1-foot contour intervals for more detail. Groundwater gradients in the NWFI system area demonstrate an east-northeast flow direction. The consistent eastward groundwater gradients created by high volume extraction south of Santa Fe Avenue have prevented western migration of chromium. These gradients have previously been reported and are supported by the decreasing chromium concentration trends at many wells east of the NWFI (CH2M 2013; CH2M and Arcadis 2013; Arcadis 2017b). Previous reporting by PG&E has suggested that the area west of the NWFI system may contain elevated levels of natural chromium not associated with the PG&E plume (CH2M and Stantec 2013). For these reasons, chromium concentrations west of the NWFI system are not likely to have come from, or be connected to, the contiguous plume to the east. Wells west of the NWFI system that were disconnected from the contiguous 3.1/3.2 µg/L isoconcentration contour include the following:

- During Second Quarter 2021, Cr(VI) and Cr(T) concentrations at MW-121D were 3.9 and 4.2, respectively, which exceed the interim background contouring thresholds. An isolated bubble was drawn around MW-121D.
- Cr(VI) and Cr(T) concentrations at MW-153S during Second Quarter 2021 were 3.2 and 4.2, respectively, which exceed the interim background contouring thresholds. An isolated bubble was drawn around MW-153S.

- During Second Quarter 2021, inactive extraction well EX-36 yielded Cr (VI) and Cr(T) concentrations of 1.4 and 3.6 µg/L and 1.4 and 6.6 µg/L, respectively. Anomalous Cr(T) concentrations compared to Cr(VI) results beginning in Fourth Quarter 2018 began to occur when full-time pumping of the well ended (Table E-1). Based on the consistent Cr(VI) results that remain below 3.1 µg/L at EX-36, it is likely that the Cr(T) results for this inactive well are affected by particulates now that the well is no longer in continuous operation. An isolated 3.1/3.2 µg/L has been drawn around EX-36 instead of connecting it to MW-153S and MW-121D, as Cr(VI) results have remained below the contouring thresholds at EX-36.

Extraction well EX-37 is screened across both the UA alluvium and LA weathered bedrock, where the transitional blue clay is present, allowing for hydraulic communication between both monitoring zones (Figure 5-3). Based on Cr(T) concentration data that are below 10 µg/L for UA extraction and monitoring locations (EX-29, EX-30, and MW-23B), concentrations greater than 10 µg/L reported for extraction well EX-37 are estimated to be localized and come primarily from the weathered bedrock. This is shown as an area with concentrations greater than 10 µg/L on the LA plume map (Figure 5-3). As a result, an isolated 10 µg/L contour remains around EX-37 on Figures 5-2 and 5-5 depicting the estimated concentration distribution of 10 µg/L in the Upper Aquifer.

In the eastern portion of the Barstow-Bakersfield Highway, the 10 µg/L isoconcentration contour remains to the east of new mid to deep zone screened extraction well EX-69, which yielded Cr(VI) and Cr(T) concentrations of 32 and 30 µg/L in Second Quarter 2021 (Figure 5-2). The 10 µg/L isoconcentration contour extension around EX-69 was not connected to the separated 10 µg/L isoconcentration contour area northeast of this well because 10 µg/L concentrations are interpreted to be present in the deep interval in the EX-69 area and shallow interval in the adjacent 10 µg/L isoconcentration contour area (MW-27A and MW-50S). While Cr(VI) and Cr(T) concentrations at MW-27A have not exceeded 10 µg/L since Second Quarter 2020, results from First Quarter 2021 (9.0 and 9.8 µg/L) are close and have fluctuated above and below 10 µg/L historically (Appendix E). Extraction well EX-69 is screened from 117 to 152 feet below ground surface (bgs), whereas MW-27A is screened from 104 to 114 feet bgs and MW-50S is screened from 80 to 95 feet bgs. Well MW-09, adjacent to EX-69, yields low chromium concentrations but is screened across the middle portion of the aquifer (118 to 128 feet bgs), so this is not estimated to be representative of the deep zone that EX-69 is drawing water from.

In response to increasing chromium concentrations at CA-MW-601, the 50 µg/L isoconcentration contour was extended north of Barstow-Bakersfield Highway in Second Quarter 2020. Cr(VI) and Cr(T) concentrations in CA-MW-601 have been greater than 10 µg/L since Fourth Quarter 2016. Cr(VI) concentrations at this well have been increasing since Second Quarter 2019, with concentrations of 14 µg/L increasing to 50 µg/L, respectively, in Second Quarter 2020. Well CA-MW-601 was not sampled during Fourth Quarter 2020 and First Quarter 2021 due to insufficient water. Well CA-MW-601 contained sufficient water for sampling and yielded concentrations of Cr(VI) and Cr(T) of 50 and 48 µg/L, respectively, in Second Quarter 2021. The chromium detections at CA-MW-601 are likely due to elevated Cr(VI) concentrations at the western end of the Central Area IRZ that cannot be addressed with existing site infrastructure. On June 6, 2019, PG&E submitted the 2019 Western IRZ Expansion Basis of Design with plans to delineate Cr(VI) and expand the remedial system to address Cr(VI) migrating to the west of the Central Area IRZ. On September 20, 2019, PG&E submitted a memorandum proposing modifications to Notice of Applicability of General Waste Discharge Requirements for IRZs and the Freshwater Injection System, which includes expanding the allowable IRZ operational area to include proposed IRZ well installations.

In the southernmost area of the plume at the compressor station (south of Community Boulevard), the 3.1/3.2 µg/L and 10 µg/L isoconcentration contours were disconnected from the contiguous contours north of this area beginning in the Third Quarter 2019. This change was made due to the observation of treatment of the chromium

plume by in situ remediation in the area at monitoring wells SA-MW-26S, SA-MW-41, SA-MW-32S, SA-SM-08S, SA-SM-04S, SA-SM-05S, SA-SM-11S, SA-MW-35S, and SA-MW-36S. See Appendix H for maps showing the concentration data supporting the revised isoconcentration contour interpretation in this area.

5.3 Northern Disputed Plume Area

The Northern Disputed Plume Area includes North Hinkley Valley (Thompson Road to Red Hill) and Water Valley (north of Red Hill). As stated in previous quarterly reports, PG&E believes that applying the interim chromium background concentrations developed for South Hinkley Valley to North Hinkley Valley/Water Valley is inappropriate. Among other issues, such as sample collection from long-screen supply wells where well construction was unknown, groundwater samples collected as part of the 2007 background study (CH2M 2007) did not include wells located north of Thompson Road; therefore, applying this standard to wells north of this area is inappropriate. The USGS is currently studying these areas in detail as part of their revised background study. The results of this effort will be used to evaluate the source and levels of naturally occurring chromium concentrations north of Thompson Road.

CAO-required monitoring wells MW-219S1 and MW-219S2, located near Coon Canyon Road and Mountain General Road, were first sampled during Fourth Quarter 2016. Cr(VI) concentrations in MW-219S1 have fluctuated above and below the 3.1 µg/L interim background value since the well was first sampled in Fourth Quarter 2016. The Northern Disputed Plume Area isoconcentration contour continues to be drawn to pass slightly east of MW-219S1 (outside of) based on Second Quarter 2021 results (both Cr(VI) and Cr(T) at 3.8 µg/L). During Fourth Quarter 2018, monitoring wells MW-226S/D on Sonoma Street east of Mountain View Road were constructed and sampled for the first time. Cr(VI) and the Cr(T) concentration results at MW-226S during Second Quarter of 2021 were 2.8 and 3.1 µg/L, respectively, below the interim background contouring thresholds. As concentrations previously exceeded the interim thresholds, the isoconcentration contour was modified westward to exclude this well. Additional sampling of MW-219S1/S2 and MW-226S/D and review of the forthcoming USGS Background Study Report is recommended before considering the need for additional well installation in this area.

During the Fourth Quarter 2020, the Cr(T) concentration at MW-131S1, located at the intersection of Hinkley Road and Fossil Bed Road, was 3.4 µg/L. The Cr(VI) and the Cr(T) concentrations at MW-131S1 in Second Quarter 2021 were 2.6 and 3.8 µg/L, respectively, which exceed the interim background contouring threshold for Cr(T). As a result of the Cr(T) concentration, an isolated 3.1/3.2 µg/L isoconcentration contour remains around MW-131S1.

5.4 Changes from the First Quarter 2021 Chromium Distribution

This section compares the maximum composite chromium plume outline for the current monitoring period with the First Quarter 2021 maximum plume outline. The extent of the 10, 50, and 1,000 µg/L contiguous isoconcentration contours for Cr(VI) and/or Cr(T), respectively, during Second Quarter 2021 were generally comparable to or smaller in extent than the contours presented in First Quarter 2021 (Arcadis 2021b). The Second Quarter 2021 maximum composite chromium plume contour lines (3.1/3.2 µg/L) generally show slight decreases in some areas and slight increases in some areas. These changes are generally interpreted to reflect natural fluctuations in the plume boundaries as remediation progresses, and not to indicate that plume migration is occurring.

Figure 5-6 shows the maximum composite plume outline (3.1/3.2 µg/L) in the UA from the Second Quarter 2021 sampling event (as shown on Figure 5-5) compared to the plume outline presented in the First Quarter 2021 report (Arcadis 2021b). The areas where the Cr(VI)/Cr(T) 3.1/3.2 µg/L plume contours changed significantly between monitoring events are summarized below. Additional slight changes to the maximum plume outline not listed below are shown on Figure 5-6 and are more an artifact of combining the contours developed for the depth-specific Figures 5-1 and 5-2 than actual changes in plume geometry.

- Northern Disputed Plume Area:
 - The inferred 3.1/3.2 µg/L chromium isoconcentration contour was contracted west of MW-226S based on the Second Quarter 2021 Cr(VI) and Cr(T) concentrations, which were below the contouring threshold at this location.
- Alcudia Road Area:
 - The 3.1/3.2 µg/L chromium isoconcentration contour was contracted east of G-5R based on Second Quarter 2021 Cr(VI) and Cr(T) concentrations, which were below the contouring thresholds at this location.
 - A bubble 3.1/3.2 µg/L contour was removed from MW-69S. This change was based on the Second Quarter 2021 Cr(VI) and Cr(T) concentrations, which were below the contouring threshold at this location.
- Acacia Street Area:
 - The 3.1/3.2 µg/L chromium isoconcentration contour was contracted west of MW-214S and MW-110S based on Second Quarter 2021 Cr(VI) and Cr(T) concentrations, which did not exceed the contouring thresholds at these locations.
- Mountain View Road Area:
 - The 3.1/3.2 µg/L chromium isoconcentration contour was contracted east of MW-108D based on Second Quarter 2021 Cr(VI) and Cr(T) concentrations, which were below the contouring thresholds at this location.
- Community Boulevard Area:
 - The 3.1/3.2 µg/L chromium isoconcentration contour was expanded west of MW-220S based on chromium results above the contouring thresholds in Second Quarter 2021.

6 Planned Activities for Third Quarter 2021

6.1 Groundwater Monitoring Program

The next site-wide groundwater monitoring is a quarterly GMP sampling event scheduled for July through September 2021 (Third Quarter 2021). Sampling and reporting for the Third Quarter 2021 GMP will be performed in accordance with the 2015 CAO and reported to the Water Board by November 10, 2021.

6.2 Domestic Well Program

Domestic well sampling will be conducted during Third Quarter 2021 in accordance with the 2015 CAO. PG&E intends to perform domestic well destruction (as described in Section 2.2) during the Third Quarter 2021 reporting period pending Water Board approval. An update on these activities will be provided in the Third Quarter 2021 GMP Report.

6.3 CAO Well Installation and Sampling

Monitoring wells proposed for installation have been installed and sampled. Existing monitoring well MW-132S was not sampled previously due to the presence of desert tortoise habitat. It can now be accessed, as the necessary biological permits have recently been approved. As discussed with the Water Board at a December 9, 2020 meeting, development and sampling of well MW-132S will be considered once the USGS background study report has been released and reviewed. PG&E will continue to provide updates in future GMP reports.

Collection of additional monitoring data from the new monitoring wells MW-226S and MW-226D and review of the forthcoming USGS background study report is recommended before considering the installation of additional monitoring wells in the MW-219S1/S2 area.

Well ID	Well Survey Findings
SC-MW-38S	Insufficient Water
TOTAL NUMBER OF WELLS: 39	

Note:

Monitoring wells with screens containing 4 feet of water or less are generally considered to have insufficient water for sampling purposes as they are not expected to yield representative monitoring results.

¹ Well MW-132S can now be accessed as the necessary biological permits have recently been approved, but it remains in an area that is likely to contain desert tortoises. There are ample monitoring locations south of MW-132S that limit the benefit of mobilizing a development rig to access this remote location, therefore consideration of proceeding with the development and sampling of well MW-132S will be considered once the USGS background study report has been released and reviewed.

Table 2-5
Wells Removed from the Domestic Well Sampling Program through First Quarter 2021
Second Quarter 2021 Groundwater Monitoring Report and Domestic Well Sampling Results
Site-wide Groundwater Monitoring Program
Pacific Gas and Electric Company, Hinkley Compressor Station, Hinkley, California

Abbreviations:
* Indicates the well has been sampled after 12/1/2011
ABN = abandoned
ACT = active
AGR = agricultural well
APN = assessor's parcel number
Cr(T) = total chromium
Cr(VI) = hexavalent chromium
DES = destroyed
DOM = domestic well
DWSP = Domestic Well Sampling Program
INACT = inactive
ND (X.XX) = non-detect, value in parantheses is the reporting limit value
PG&E = Pacific Gas and Electric Company
ppb = parts per billion
WTR = water well

Reference:
California Regional Water Quality Control Board' Lahontan Region. 2015. Cleanup and Abatement Order No. R6v-2015-0068 Requiring PG&E to Cleanup and Abate Waste Discharge of Total Hexavalent Chromium to the Groundwaters of the Mojave Hydrologic Unit, PG&E Compressor Station, Hinkley, San Bernardino County. November 4.

- = domestic well is located within 2,000 feet of a multi-level monitoring well (Group 1)
- = domestic well is not located within 2,000 feet of a multi-level monitoring well. Cr(VI) and Cr(T) concentrations after September 29, 2011 are below 2 ppb (Group 2)
- = domestic well is not located within 2,000 feet of a multi-level monitoring well (Group 3)

Notes:

See Table 4-3 for chromium sampling results for PG&E's Domestic Well Sampling Program.

^a Samples were collected after isolating deep screen of extraction well with a packer.

^b Sample collected prior to operation of extraction well pump, therefore results are not considered representative of the groundwater within the well.

 = Well sampled during the current quarter groundwater monitoring period

Abbreviations:

--- = sample not analyzed for this parameter

µg/L = micrograms per liter

dup = Results shown are for a duplicate groundwater sample taken on this date.

J = Analyte was present in the sample but the laboratory reported concentration is qualified as estimated by data validation because one or more quality control criteria were not met.

LL = low level

ND (x.x) = parameter is not detected at the reporting limit shown in parentheses

PG&E = Pacific Gas and Electric Company

Note:

According to Cleanup and Abatement Order No. R6V-2015-0068 (dated November 4, 2015; 2015 CAO), if sample results show a relative percent difference of 25 percent or greater between Cr(VI) and Cr(T) concentrations and if both concentrations are less than 10 ppb, and Cr(VI) is greater than 3.1 ppb and Cr(T) is greater than 3.2 ppb, then the samples must be reanalyzed within the same quarter. In addition, if sample results have Cr(VI)/Cr(T) difference greater than 1.0 ppb at concentrations below 4 ppb, then the sample must be reanalyzed within the same quarter.

Abbreviations:

% = percent
µg/L = micrograms per liter
CAO = Cleanup and Abatement Order
Cr(VI) = hexavalent chromium
Cr(T) = total chromium
N = normal sample
ND (x.xx) = not detected, value in parenthesis is the reporting limit
ppb = parts per billion
RPD = relative percent difference

IN THE SHALLOW ZONE OF THE UPPER AQUIFER,
SECOND QUARTER 2021**

SECOND QUARTER 2021 GROUNDWATER MONITORING
REPORT AND DOMESTIC WELL RESULTS
SITE-WIDE GROUNDWATER MONITORING PROGRAM

PACIFIC GAS AND ELECTRIC COMPANY
HINKLEY COMPRESSOR STATION
HINKLEY, CALIFORNIA

LEGEND:

- Groundwater Monitoring Well
- Agricultural Supply Well
- Other Supply Well
- ⊠ Groundwater Extraction Well
- ⊠ Multi-use Test Well, or Inactive Extraction/Injection Well
- ⊠ Freshwater Injection Well
- PG&E Compressor Station
- Approximate Limit of Saturated Alluvium Upper Aquifer
- Approximate Location of Lockhart Fault;
- Fault Trace is Inferred, and There is No Surface Expression (Stamos et al. 2001)
- Bedrock Exposed at Ground Surface

MW-177D Well ID
1.9/2.1 Cr(VI)/Cr(T) concentrations in µg/L; maximum of primary and duplicate samples during Second Quarter 2021 sampling. Data in parentheses are from previous reporting period. See Table E-1 for sample dates.

Groundwater Cr(VI) concentrations in monitoring wells:

- More than 1,000 µg/L
- 100 to 1,000 µg/L
- 50 to 100 µg/L
- 10 to 50 µg/L
- 3.1 to 10 µg/L
- Less than 3.1 µg/L or ND

ABBREVIATIONS:

µg/L	Micrograms per Liter
Cr(VI)	Hexavalent Chromium
Cr(T)	Total Dissolved Chromium
ND	Not Detected
NS	Not Sampled
PG&E	Pacific Gas and Electric Company

NOTES:

- Chromium results are shown for Site-wide Groundwater Monitoring Program and domestic wells sampled in the Second Quarter (April through June) 2021 monitoring period. For wells sampled multiple times during the reporting period, the most recent results are shown.
- Chromium plume contours in the general area south of Highway 58 were developed using a larger set of monitoring data, which are presented in the Second Quarter 2021 Monitoring Report for the In Situ Reactive Zone and Northwest Freshwater Injection Projects (Arcadis 2021). Select wells from that program are shown here for reference.
- Pursuant to the Lahontan Regional Water Quality Control Board's Cleanup and Abatement Order dated November 4, 2015 (Water Board 2015), groundwater monitoring wells are not used for chromium contouring if they are located in the areas southwest of the Lockhart Fault and on or east of Dixie Road.

HINKLEY, CALIFORNIA

LEGEND:

- Extraction Well Operated for Lower Aquifer Remediation
- Lower Aquifer Groundwater Monitoring Well
- Lower Aquifer Supply Wells
- Bedrock Exposed at Ground Surface
- Approximate Western Limits of Blue Clay Occurrence. The Blue Clay does not begin to form an aquitard separating the Upper and Lower Aquifers until east of the blue shaded transitional area.
- Approximate Location of Lockhart Fault; Fault Trace is Inferred, and There is No Surface Expression (Stamos et al. 2001)
- PG&E-Owned Property
- PG&E Compressor Station
- Approximate Transitional Area where the Blue Clay is only intermittently present, thin and sandy. There is no Lower Aquifer in this area. Although identified as Lower Aquifer wells with "C" designations, monitoring wells in this area are screened across weathered bedrock at the base of the Upper Aquifer and are not Lower Aquifer monitoring wells.

Groundwater Cr(VI) concentrations in monitoring wells:

- Greater than 10 µg/L
- 3.1 µg/L to 10 µg/L
- 0.2 µg/L to 3.1 µg/L
- Less than 0.2 µg/L or ND

ABBREVIATIONS:

- µg/L Micrograms per Liter
- Cr(VI) Hexavalent Chromium
- Cr(T) Total Dissolved Chromium
- ND Not Detected
- PG&E Pacific Gas and Electric Company

NOTES:

1. Chromium concentration contours are based on April through June 2021 sampling of groundwater monitoring wells. Results are shown for wells completed in the Lower Aquifer (saturated zone below the Blue Clay aquitard). The Blue Clay is thin, sandy or absent in portions of its western extent. In these areas, Lower Aquifer monitoring wells may be in hydraulic communication with the Upper Aquifer.

290/310: Cr(VI)/Cr(III) concentrations in µg/L, maximum of primary and duplicate samples during Second Quarter 2021 sampling. Data in parentheses are from previous reporting period. See Table E-1 for sample dates.

NOTES:

- Chromium results are shown for Site-wide Groundwater Monitoring Program and domestic wells sampled in the Second Quarter (April through June) 2021 monitoring period. For wells sampled multiple times during the reporting period, the most recent results are shown.
- The concentration contours are based on Second Quarter 2021 chromium results for the groundwater monitoring and extraction wells that are completed in the shallow zone and deep zone of the Upper Aquifer as noted on Figures 5-1 and 5-2. Results for domestic wells (brown-colored labels) were not used for chromium plume contouring, except for those in the northern plume areas, pursuant to the Laborers Regional Water Quality Control Board's Cleanup and Abatement Order dated November 4, 2015 (Water Board 2015).
- Pursuant to the Laborers Regional Water Quality Control Board's Cleanup and Abatement Order dated November 4, 2015 (Water Board 2015), groundwater monitoring wells are not used for chromium contouring if they are located in the areas southwest of the Lockhart Fault and/or east of Dixie Road. Monitoring wells sampled southwest of Lockhart Fault and east of Dixie Road were sampled in support of United States Geological Survey background chromium investigation.
- Chromium plume contours in the general area south of Highway 58, were developed using a larger set of monitoring data which is presented in the Second Quarter 2021 Monitoring Report in the In Situ Reactive Zone and Northwest Freeway Injection Projects (Arcadis 2021). Select wells from that program are shown here for reference.

SOP-A12	Decontamination of Water Sampling Equipment
SOP-A13	Measurement of Well Total Depth

SOP-A1

Purging and Sampling of Monitoring Wells with Dedicated Submersible Pumps / Well Casing Volume Method Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for purging and sampling groundwater monitoring wells at the Hinkley site that are equipped with a dedicated electric pump. Purging and sampling of these wells requires an electric submersible dedicated pump with a controllable discharge rate (Grundfos Redi-Flo 2 or similar pump and flow controller), or an electric submersible dedicated pump with a single discharge rate (no flow controller). A well-volume based purging and sampling method will be used for these wells.

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction and previous depth to water information is provided in the PST.
- Blank purge and sampling log sheets.

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) Field-check and setup sampling equipment: water level (WL) meter, water quality (WQ) meters, flow-through cell, field filters, health and safety equipment, etc. Inspect and calibrate field equipment prior to use according to SOP-A11, *Calibration of Field Instruments*.
- 3) Inventory sample bottles, review required analyses, confirm the lab courier schedule, and prepare groundwater sampling log.
- 4) Open the well protection lid and measure initial static WL according to SOP-A9, *Water Level Measurements*. Record the WL value on the sampling log. Always measure water level before temporarily removing any pressure transducer, according to SOP-C1, *Temporary Removal and Replacement of Pressure Transducers*. **If the initial static WL measurement indicates that the well contains a water column of less than 4.0 feet, the well does not contain sufficient water to proceed with purging and sampling. Proceed to Step 9.**

PURGING AND SAMPLING PROCEDURES – MONITORING WELLS WITH DEDICATED SUBMERSIBLE PUMPS

- 5) Use the water level determined in Step 4 above and the total depth provided in the PST and/or the well-specific purge log to calculate the standing water column in the well and one well casing volume.

- 6) Well purging will take place **until at least one well casing volume has been purged and field parameters have stabilized.** The purging rate shall be adjusted to obtain minimal drawdown. Field parameters (pH, specific conductance, temperature, ORP, dissolved oxygen, and turbidity) will be measured using a flow-through cell and the units indicated on the purge form. Record units and time for all measurements collected. Record on the sampling log if parameter readings are anomalous or unstable due to instrument problem. If a flow controller is present, decrease the purge rate and measure/record new purge rate if significant drawdown is observed. Significant drawdown is considered to be 5% of the total height of the water column or to the top of screen.
- 7) Indicator parameters are considered stabilized when three consecutive readings made several minutes apart fall within the following EPA stabilization criteria:

pH	+/- 0.1 pH units
Specific conductance	+/- 3% ($\mu\text{S}/\text{cm}$ or mS/cm units)
ORP	+/- 10 millivolts
Turbidity	+/- 10% NTU units (when turbidity is >10 NTUs)
Dissolved oxygen	+/- 0.3 mg/L
Temperature	+/- 2° Celsius.
- 8) Collect samples for analyses according to the PST and/or event-specific field instructions. For all samples, decrease the discharge rate to reduce water turbulence at the pump discharge point. To reduce or prevent the need to stop the pump between purging and sampling and to regulate the flow through the flow-through-cell during purging, a dedicated inline splitter ("Y Valve") will be used upstream from the flow-through-cell. The splitter will have one influent and two effluent lines. One effluent line will be attached to the flow-through-cell and from there to waste; the second effluent line will be used as the sampling port. Each effluent line should be capable of flow control. If the PST calls for filtered and/or preserved samples, refer to SOP-A8, *Sample Field Filtration and Preservation for Metals*. Record observations on sample appearance, clarity, and odors.
- 9) Complete the field sampling log, including description of samples collected, final WL, and total volume purged. Close and secure the well including access gates and/or fences.

LOW VOLUME AND POOR RECOVERY WELLS

Some groundwater monitoring wells may exhibit slow or poor recovery upon purging. These groundwater monitoring wells may not recover sufficiently during purging and run completely dry without an opportunity to collect the required series of groundwater stabilization parameters, or run dry prior to sampling. In the unlikely event a monitoring well with a dedicated pump may exhibit these conditions, refer to SOP-A2, *Purging and Sampling of Monitoring Wells with Temporary Submersible Pumps – Low Volume and Poor Recovery Wells* for further instructions.

INVESTIGATION-DERIVED WASTE MANAGEMENT

Different types of potentially-contaminated investigation-derived waste (IDW) will be generated during groundwater sampling efforts. These may include:

- Used personal protective equipment (PPE).
- Disposable sampling equipment.
- Decontamination fluids.
- Purged groundwater and excess groundwater collected for sample container filling.

Used PPE and disposable equipment will be placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of that could still be reused will be rendered inoperable before disposal in the refuse dumpster.

All wastewater (decontamination water, and purge and excess groundwater) generated during sampling of monitoring wells will be containerized and disposed of as instructed by PG&E: dispose of at the Central or Source IRZ holding tanks.

SOP-A2

Purging and Sampling of Monitoring Wells with Temporary Submersible Pumps / Stabilized Drawdown Method Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for purging and sampling groundwater monitoring wells at the Hinkley site using a temporary submersible pump with a controllable discharge rate (Grundfos Redi-Flo 2 or similar pump and flow controller). A stabilized drawdown purging and sampling method will be used for these wells.

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction and previous depth to water information is provided in the PST.
- Blank purge and sampling log sheets.

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) To avoid cross-contamination, on-site decontamination of the temporary pump and all non-dedicated sampling equipment is mandatory prior to first sampling and between each well. Equipment decontamination will include flushing of the internal components of the submersible pump and tubing assembly dedicated for each well cluster, as well as external washing of the pump and submerged tubing with Alconox solution and fresh water rinsing. See SOP-A12, *Decontamination of Water Sampling Equipment*, for additional equipment decontamination procedures.
- 3) Field-check and setup sampling equipment: water level (WL) meter, water quality (WQ) meters, flow-through cell, temporary pump, pump control, power supply, new dedicated tubing, field filter, purge water container, health safety equipment, etc. Inspect and calibrate field equipment prior to use according to SOP-A11, *Calibration of Field Instruments*.
- 4) Inventory sample bottles, review required analyses, confirm the lab courier schedule, and prepare groundwater sampling log.
- 5) Open the well protection lid and measure initial static WL according to SOP-A9, *Water Level Measurements*. Measure the total well depth. Record WL and total well depth measurements on sampling log. Always measure water level before temporarily removing any pressure transducer, according to SOP C-1, *Temporary Removal and Replacement of Pressure Transducers*. **If the initial static WL measurement indicates that the well contains a water column of less than 4.0 feet, the well does not contain sufficient water to proceed with purging and sampling. Skip to Step 11.**

PURGING AND SAMPLING PROCEDURES – MONITORING WELLS WITH TEMPORARY SUBMERSIBLE PUMPS

- 6) The temporary pump assembly will be lowered to the **mid-screen target sampling depth** for purging and sampling. Confirm the well screen interval in feet below top of casing (feet TOC). The well pump intake shall be placed at the mid-screen depth, feet TOC, ± 1.0 foot.

- 7) Use the water level and total well depth information determined in Step 5 above to calculate the standing water column in the well and one casing volume.

Well purging will take place until a **minimum of one well casing volume has been removed and field parameters have stabilized (field parameters have changed from the initial readings and then stabilized)**. However, purging of monitoring wells **MW-185S1, MW-186S1, MW-188S1, MW-193S2, MW-194S1, MW-195S1, and MW-195S2** will take place until a minimum of **three well casing volumes** have been removed and field parameters have stabilized.

- 8) The purging rate shall be adjusted to obtain minimal drawdown. Field parameters (pH, specific conductance, temperature, ORP, dissolved oxygen, and turbidity) will be measured using a flow-through cell and the units indicated on the purge form. Record units and time for all measurements collected. Record on the sampling log if parameter readings are anomalous or unstable due to instrument problem. Decrease the purge rate and measure/record new purge rate if significant drawdown is observed. Significant drawdown is considered to be 5% of the total height of the water column or to the top of screen

- 9) Indicator parameters are considered stabilized when three consecutive readings made several minutes apart fall within the following EPA stabilization criteria:

pH	+/- 0.1 pH units
Specific conductance	+/- 3% ($\mu\text{S}/\text{cm}$ or mS/cm units)
ORP	+/- 10 millivolts
Turbidity	+/- 10% NTU units (when turbidity is >10 NTUs)
Dissolved oxygen	+/- 0.3 mg/L
Temperature	+/- 2° Celsius

Collect, **but DO NOT submit for laboratory analysis**, samples from wells where indicator parameters have stabilized but turbidity is out of range (>999 NTU) and/or the color of the purge water prior to filtering remains a color such as brown, tan, or orange. Notify the CH2M HILL Field Manager of the conditions encountered. Store the samples according to the procedures outlined for sample preservation in the *Quality Assurance Project Plan*.

pH values for some wells located north of Thompson Road are commonly above 9. When pH values above 9 are encountered the instrument's calibration should be verified, and the verification procedure documented on the sampling log. Notify the CH2M HILL Field Manager of the conditions encountered.

- 10) Collect samples for analyses according to the PST and/or event-specific field instructions. For all samples, decrease the discharge rate to reduce water turbulence at the pump discharge point. To reduce or prevent the need to stop the pump between

purging and sampling and to regulate the flow through the flow-through-cell during purging a dedicated inline splitter ("Y Valve") will be used upstream from the flow-through-cell. The splitter will have one influent and two effluent lines. One effluent line will be attached to the flow-through-cell and from there to waste; the second effluent line will be used as the sampling port. Each effluent line should be capable of flow control. If the PST calls for filtered and/or preserved samples, refer to SOP-A8, *Sample Field Filtration and Preservation for Metals*. Record observations on sample appearance, clarity, and odors.

- 11) Complete the field sampling log, including description of samples collected, final WL, and total volume purged. Close and secure the well including access gates and/or fences.

LOW VOLUME AND POOR RECOVERY WELLS

Some groundwater monitoring wells may exhibit slow or poor recovery upon purging. These groundwater monitoring wells may not recover sufficiently during purging and run completely dry without an opportunity to collect the required series of groundwater stabilization parameters, or run dry prior to sampling. The following procedures should be followed for collection representative groundwater samples from wells that go dry during purging activities in preparation for groundwater sampling. Follow steps 1 to 7 as showed in previous section.

- 12) Ideally, well purging will continue until a **minimum of one to three well casing volumes have been removed and field parameters have stabilized** (field parameters have changed from the initial readings and then stabilized), according to Steps 1 through 11. If the well purges dry during the observation period, immediately shut off the pump and collect a final set of water quality parameters (ph, specific conductance, ORP, turbidity, dissolved oxygen, and temperature).
- 13) Record the final water level, note the time, the volume of water discharged and the elapsed time for the complete discharge of the well. Inform the CH2M HILL Field Manager of the conditions encountered (low volume/poor recovery) before proceeding with the steps below.
- 14) Allow the well to recharge to 80 percent of the original height of the water column. The goal is to go back to the wells that purge dry and collect samples within 3-5 days of initial purging. The recovery period to achieve 80 percent of the height of the water column could take longer than 3 to 5 days in some instances. CH2M HILL Hinkley project-level staff should be consulted prior to sampling wells that have not achieved 80 percent recovery within 3 to 5 days.
- 15) Calculate the volume of water in the well and volume of water needed to fill all of the sample containers. Initiate procedures for the well sampling. Begin to slowly purge the well and collect at least one set of water quality parameters prior to filling the sample containers.
- 16) If there is insufficient water volume to allow sampling with a submersible pump, a disposable bailer may be used with the approval of the Field Manager. Refer to SOP-A4,

Sampling of Low Volume and Poor Recovery Monitoring Wells with a Disposable Bailer and do not continue to Step 18 below.

- 17) Collect samples for analyses according to the PST and/or event-specific field instructions. Samples are collected directly from the temporary pump discharge tubing. Make sure flow-through cell is disconnected before sample collection. If the PST calls for filtered and/or preserved samples, refer to SOP-A8, *Sample Field Filtration and Preservation for Metals*. Record observations on sample appearance, clarity, and odors.
- 18) Complete the field sampling log, including description of samples collected, final WL, and total volume purged. Close and secure the well including access gates and/or fences.

INVESTIGATION-DERIVED WASTE MANAGEMENT

Different types of potentially-contaminated investigation-derived waste (IDW) will be generated during groundwater sampling efforts. These may include:

- Used personal protective equipment (PPE).
- Disposable sampling equipment.
- Decontamination fluids.
- Purged groundwater and excess groundwater collected for sample container filling.

Used PPE and disposable equipment will be placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of that could still be reused will be rendered inoperable before disposal in the refuse dumpster.

All wastewater (decontamination water, and purge and excess groundwater) generated during sampling of monitoring wells will be containerized and disposed of as instructed by PG&E: dispose of at the Central or Source IRZ holding tanks

SOP-A3

Purging and Sampling of Monitoring Wells with Dedicated QED Pumps / Low- Flow Purging Method Standard Operating Procedure for Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for purging and sampling all groundwater monitoring wells at the Hinkley site that are equipped with a dedicated QED bladder pump. Purging and sampling of these wells requires a dedicated QED Well Wizard micro-purge bladder pump, A MP10 controller box and air compressor. A low-flow (minimal drawdown) purging and sampling method will be used for these wells. The low-flow sampling method described herein has been adapted from the protocols specified by EPA in their groundwater monitoring guidance (EPA, 1996).

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction and previous depth to water information is provided in the PST.
- Blank purge and sampling log sheets.

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) Field-check and setup sampling equipment: water level (WL) meter, water quality (WQ) meters, flow-through cell, temporary pump, pump control, power supply, new dedicated tubing, field filter, purge water container, health safety equipment, etc. Inspect and calibrate field equipment prior to use according to SOP-A11, *Calibration of Field Instruments*.
- 3) Inventory sample bottles, review required analyses, confirm the lab courier schedule, and prepare groundwater sampling log.
- 4) Open the well protection lid and measure initial static WL according to SOP-A9, *Water Level Measurements*. Record the WL value on the sampling log. Always measure water level before temporarily removing any pressure transducer, according to SOP-C1, *Temporary Removal and Replacement of Pressure Transducers*. **If the initial static WL measurement indicates that the well contains a water column of less than 4.0 feet, the well does not contain sufficient water to proceed with purging and sampling; Skip to Step 9.**

PURGING AND SAMPLING PROCEDURES – MONITORING WELLS WITH DEDICATED QED PUMPS

- 5) Check previous purge records for insight into the proper rate. The sampling procedure for QED wells is purging **three pump line volumes (typically between 4 to 5 L) at a rate not to exceed 0.5 L/min.**
- 6) Well purging will take place until **three pump line volumes have been purged and field parameters have stabilized.** Field parameters (pH, specific conductance, temperature, ORP, dissolved oxygen, and turbidity) will be measured using a flow-through cell and the units indicated on the purge form. Collect water level measurements frequently during the purging to ensure that the water level has not dropped lower than desired. Record time for all measurements collected. Record on the sampling log if parameter readings are anomalous or unstable due to instrument problem. Decrease the purge rate and measure/record new purge rate if significant drawdown is observed. Significant drawdown is considered to be 5% of the total height of the water column or to the top of screen.
- 7) Indicator parameters are considered stabilized when three consecutive readings made several minutes apart fall within the following EPA stabilization criteria:

pH	+/- 0.1 pH units
Specific conductance	+/- 3% ($\mu\text{S}/\text{cm}$ or mS/cm units)
ORP	+/- 10 millivolts
Turbidity	+/- 10% NTU units (when turbidity is >10 NTUs)
Dissolved oxygen	+/- 0.3 mg/L
Temperature	+/- 2° Celsius
- 8) Collect samples for analyses according to the PST and/or event-specific field instructions. For all samples, decrease the discharge rate to reduce water turbulence at the pump discharge point. If the PST calls for filtered and/or preserved samples, refer to SOP-A8, *Sample Field Filtration and Preservation for Metals*. Record observations on sample appearance, clarity, and odors.
- 9) Complete the field sampling log, including description of samples collected, final WL, and total volume purged. Close and secure the well including access gates and/or fences.

INVESTIGATION-DERIVED WASTE MANAGEMENT

Different types of potentially-contaminated investigation-derived waste (IDW) will be generated during groundwater sampling efforts. These may include:

- Used personal protective equipment (PPE).
- Disposable sampling equipment.
- Decontamination fluids.
- Purged groundwater and excess groundwater collected for sample container filling.

Used PPE and disposable equipment will be placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and

disposable equipment that is to be disposed of that could still be reused will be rendered inoperable before disposal in the refuse dumpster.

All wastewater (decontamination water, and purge and excess groundwater) generated during sampling of monitoring wells will be containerized and disposed of as instructed by PG&E: dispose of at the Central or Source IRZ holding tanks.

SOP-A4

Purging and Sampling of Monitoring Wells with a Disposable Bailer Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for purging and sampling groundwater monitoring wells at the Hinkley site using single or double check valve disposable bailers. A three well volume purging and parameter stabilization sampling method will be used for these wells where possible.

Some groundwater monitoring wells may contain insufficient water to sample using submersible pumps according to SOP-A1 (*Purging and Sampling of Monitoring Wells with Dedicated Submersible Pumps*) or SOP-A2 (*Purging and Sampling of Monitoring Wells with Temporary Submersible Pumps*). The following procedures should be followed for the collection of representative groundwater samples from these wells. The approval from the CH2M HILL Field Manager must be obtained prior to collecting any groundwater samples with a disposable bailer.

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction and previous depth to water information is provided in the PST.
- Blank purge and sampling log sheets.

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) To avoid cross-contamination, on-site decontamination of the bailer and all non-dedicated sampling equipment is mandatory prior to first sampling. See SOP-A12, *Decontamination of Water Sampling Equipment*, for additional equipment decontamination procedures.

Y Keep the bailer in the original protective wrapping until just before use, and use clean, single-use gloves to handle bailer once it is removed from the wrapping. Handle the bailer by the lanyard to minimize contact with the bailer surface. Equipment decontamination will include flushing of the bailer with Alconox solution and fresh water rinsing.

Y Discard cotton twine, nylon and non-stainless steel braided lanyards after sampling each well. Lanyards made of stainless steel, coated Teflon, polyethylene or polypropylene can be decontaminated between monitoring wells with Alconox solution and fresh water rinsing.

- 3) Field-check, calibrate and setup sampling equipment: water level (WL) meter, water quality (WQ) meters, bailers and lanyards compatible with the analytes of interest, field

filters, purge water container, health safety equipment, etc. Inspect and calibrate field equipment prior to use according to SOP-A11, *Calibration of Field Instruments*.

Y Teflon, polyethylene or polypropylene bailers may be used for all analytes.

Y Lanyards must be made of non-reactive, non-leachable material such as cotton twine, nylon or stainless steel; or, coated with Teflon, polyethylene or polypropylene. Evaluate the appropriateness of the lanyard material with analyses of equipment blanks for the analytes of interest, as necessary.

- 4) Inventory sample bottles, review required analyses, confirm the lab courier schedule, and prepare groundwater sampling log.
- 5) Open the well protection lid and measure initial static WL according to SOP-A9, *Water Level Measurements*. Measure the total well depth if no dedicated submersible pump is present in the well casing. Record WL and total depth measurements on the sampling log. Always measure water level before temporarily removing any pressure transducer, according to SOP C-1, *Temporary Removal and Replacement of Pressure Transducers*. **If the initial static WL measurement indicates that the well contains a water column of less than 4.0 feet, the well does not contain sufficient water to proceed with purging and sampling; Skip to Step 21.**

GROUDWATER PURGING AND SAMPLING PROCEDURES - LOW VOLUME MONITORING WELLS WITH DISPOSABLE BAILERS

- 6) Use the water level determined in Step 5 above and the total depth provided in the PST and/or the well-specific purge form, or measured in Step 5 above, to calculate the standing water column in the well and one casing volume.
- 7) Remove the bailer from its protective wrapping just before use. Attach the lanyard to the bailer at one end, and to either the protective casing of the well or to the sampler's wrist at the other. At no time should the bailer or lanyard touch the ground during the sampling process.
- 8) Slowly lower the bailer taking care not to disturb the water column or stir up sediment in the well. Allow time for the bailer to fill with water as it descends into the water column.
- 9) Carefully raise the bailer from the water column until the bailer has cleared the surface of the water. Record the volume of the bailer in the field sampling log.
- 10) Continue to carefully lower and retrieve the bailer as described.
- 11) Remove at least one well volume before collecting measurements of field parameters (pH, specific conductance, temperature, ORP, dissolved oxygen, and turbidity) from the initial bailer of water before discarding. Take each subsequent set of measurements after removing at least one half (1/2) of the casing volume. Record units and time for all measurements collected. Record on the sampling log if parameter readings are anomalous or unstable.
- 12) Continue purging until a minimum of three well casings volume has been removed and field parameters have stabilized (field parameters have changed from the initial readings and then stabilized).

- 13) Indicator parameters are considered stabilized when three consecutive readings made several minutes apart fall within the following EPA stabilization criteria:
- | | |
|----------------------|--|
| pH | +/- 0.1 pH units |
| Specific conductance | +/- 3% ($\mu\text{S}/\text{cm}$ or mS/cm units) |
| ORP | +/- 10 millivolts |
| Turbidity | +/- 10% NTU units (when turbidity is >10 NTUs) |
| Dissolved oxygen | +/- 0.3 mg/L |
| Temperature | +/- 2° Celsius |
- 14) After purging, the bailer should be lowered into the water column to within one foot of the mid-screen target sampling depth to collect the sample. Samples should not be collected from the top of the water column, as this may not be representative of the groundwater flowing through the well screen. Discard the first few inches of water in the bailer. Collect the sample directly from the bailer by allowing the sample to slowly flow down the side of the container. Care should be taken when using bottom decanting bailers, as the full head of water in the bailer can force the water out quickly and cause aeration and overfilling of containers with possible loss of preservatives. Discard the last few inches of water in the bailer.
- 15) Collect samples for analyses according to the PST and/or event-specific field instructions. If the PST calls for filtered and/or preserved samples, refer to SOP-A8, *Sample Field Filtration and Preservation for Metal Analyses*. Record observations of sample appearance, clarity, and odors in the sampling log.
- 16) Complete the field sampling log, including description of samples collected, final WL, and total volume purged. Close and secure the well including access gates and/or fences.

GRAB GROUNDWATER SAMPLING PROCEDURES - POOR RECOVERY MONITORING WELLS WITH DISPOSABLE BAILERS

Some groundwater monitoring wells may exhibit both low volume, making them unsuitable for purging and sampling by submersible pump per SOP-A1 or SOP-A2, and slow or poor recovery upon purging. These groundwater monitoring wells may not recover sufficiently during purging and run completely dry without an opportunity to collect the required series of groundwater stabilization parameters, or run dry prior to sampling.

The following procedures should be followed for collection representative groundwater samples from wells that go dry during purging activities in preparation for groundwater sampling. Follow steps 1 to 11 in the previous section before continuing with the step below.

- 17) Allow the well to recharge to 80 percent of the original height of the water column. Ideally, this should be within 24 hours of the groundwater monitoring well being purged dry. The recovery period to achieve 80 percent of the height of the water column could take longer than 24 hours in some instances. CH2M HILL Hinkley project-level staff should be consulted prior to sampling wells that have not achieved 80 percent recovery within 24 hours.
- 18) Calculate the volume of water in the well and volume of water needed to fill all of the sample containers. Initiate procedures for the well sampling. Begin to slowly purge the

well and collect at least one set of water quality parameters prior to filling the sample containers.

- 19) The bailer should be lowered into the water column to within one foot of the mid-screen target sampling depth to collect the sample. Samples should not be collected from the top of the water column, as this may not be representative of the groundwater flowing through the well screen. Discard the first and last few inches of water in the bailer. Samples are collected directly from the bailer by allowing the sample to slowly flow down the side of the container. Care should be taken when using bottom decanting bailers, as the full head of water in the bailer can force the water out quickly and cause aeration and overfilling of containers with possible loss of preservatives.
- 20) Collect samples for analyses according to the PST and/or event-specific field instructions. If the PST calls for filtered and/or preserved samples, refer to SOP-A8, *Sample Field Filtration and Preservation for Metals*. Record observations on sample appearance, clarity, and odors.
- 21) Complete the field sampling log, including description of samples collected, final WL, and total volume purged. Close and secure the well including access gates and/or fences.

INVESTIGATION-DERIVED WASTE MANAGEMENT

Different types of potentially-contaminated investigation-derived waste (IDW) will be generated during groundwater sampling efforts. These may include:

- Used personal protective equipment (PPE).
- Disposable sampling equipment.
- Decontamination fluids.
- Purged groundwater and excess groundwater collected for sample container filling.

Used PPE and disposable equipment will be placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of that could still be reused will be rendered inoperable before disposal in the refuse dumpster.

All wastewater (decontamination water, and purge and excess groundwater) generated during sampling of monitoring wells will be containerized and disposed of as instructed by PG&E: dispose of at the Central or Source IRZ holding tanks.

SOP-A5

Purging and Sampling of Supply Wells with Dedicated Pumps Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for groundwater sampling of active and inactive water supply or production wells that are **equipped with dedicated and functional well pumps** at the PG&E Hinkley site. This SOP also applies to groundwater sampling of active or inactive extraction and test wells that are equipped with dedicated pumps.

All samples for water quality (WQ) measurement and laboratory analysis are collected directly from existing or installed sampling ports at the well head/ discharge piping. Samples should not be collected from supply well holding tanks unless required by the well owner and well-specific project instructions.

The dedicated-pump water supply, extraction, and test wells are typically large-diameter (6-inch or greater diameter casing) and have long perforated/ screen intervals, and therefore, the purging and sampling procedures are different from the procedures used for sampling conventional groundwater monitoring wells. Supply or extraction wells that are actively pumping can be sampled directly without satisfying purging criteria after water contained in the sampling pump and associated tubing/ plumbing has been purged. For dedicated-pump wells that are inactive (i.e., not used for routine or daily production), a 'minimum purge' with stabilized field parameters sampling method is used as described below.

REQUIRED DOCUMENTS

- Event-specific "planned sampling and analysis table" (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction and previous depth to water information is provided in the PST.
- Blank purge and sampling log sheets.

PREPARATION AND SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) Field-check and setup sampling equipment: water level (WL) meter, water quality (WQ) meters, flow-through cell, field filter, purge water container, health and safety equipment, etc. Inspect and calibrate field equipment prior to use according to SOP-A11, *Calibration of Field Instruments*.
- 3) Inventory sample bottles, review required analyses, confirm the lab courier schedule, and prepare groundwater sampling log.
- 4) If well is equipped with a transducer and transducer removal is required for sampling, follow SOP-C1, *Temporary Removal and Replacement of Transducers*.

- 5) Confirm condition of the well's pump and discharge sampling port and install or use temporary fittings as needed. Consult with the well owner before modifying the well's sampling port. If the well's dedicated pump is not functioning, contact the Project Manager or Field Team Manager for instructions. SOP-A6, *Purging and Sampling of Supply Wells without Dedicated Pumps* may be used if applicable for the well and confirmed by the Project Manager.
- 6) Confirm and note the operation status of the supply well from well head meter or well owner information. Well status should be noted as:
 - a) active - currently pumping,
 - b) active - cycling daily operation, or
 - c) inactive - last operation occurred: date.
- 7) If the supply/production well has been inactive for more than 24 hours, a water level measurement can be taken. Measure initial static WL according to SOP-A9, *Water Level Measurements*. Record WL value on sampling log.

SAMPLING PROCEDURE – CURRENTLY PUMPING ACTIVE SUPPLY WELLS

- 8) Install a flow-through cell to the sampling port and record one set of water quality parameters (pH, conductivity, temperature, turbidity, dissolved oxygen, temperature, and ORP). If it is not possible to connect the flow-through cell, a clean 5-gallon bucket may be used by filling the bucket with purge water and inserting the instrument probes directly into the bucket. If the bucket is used, turbulence in the bucket should be minimized and only pH, conductivity, ORP, and temperature need to be recorded. Record units and time for all measurements collected. Record on the sampling log if any parameter readings are anomalous or unstable due to instrument problems.
- 9) For actively pumping wells, samples can be collected directly from the dedicated pump discharge. A single set of field parameters should be recorded. (collecting stabilized field parameters is not required). Record observations on sample appearance, clarity, and odors.
- 10) Collect samples for analyses according to the PST and/or event-specific field instructions. To reduce or prevent the need to stop the pump between purging and sampling and to regulate the flow through the flow-through-cell during purging, a dedicated inline splitter ("Y Valve") will be used upstream from the flow-through-cell. The splitter will have one influent and two effluent lines. One effluent line will be attached to the flow-through-cell and from there to waste; the second effluent line will be used as the sampling port. Each effluent line should be capable of flow control. Sample containers are to be filled by transferring water directly from the pump discharge or sampling spigot to the appropriate sample container. If the PST calls for filtered and/or preserved samples, refer to SOP-A9, *Sample Field Filtration and Preservation for Metals*.
- 11) Complete the field sampling log, including description of samples collected, final WL, and purge volume of discharge or purge. If the pump is equipped with a flow meter, record the flow rate as well. Close and secure the well including access gates or fences.

SAMPLING PROCEDURE - ACTIVE CYCLING (CURRENTLY OFF) SUPPLY WELLS

If the supply well is confirmed to be active but is not currently pumping at the time of sampling, the well pump system needs to be operated/purged for a minimum period before water samples are collected. The extent of purging will vary depending on the well conditions and should be based on well owner information and prior sampling experience at the subject well. Groundwater samples should not be collected until sufficient flushing of the dedicated pump discharge system has occurred (typically a minimum 5 minutes) and stabilized field parameters are recorded.

- 12) Install a flow-through cell to the sampling port for measuring water quality parameters (pH, conductivity, temperature, turbidity, dissolved oxygen, temperature, and ORP). If it is not possible to connect the flow-through cell, a clean 5-gallon bucket may be used, as described in Step 8 above. Record units and time for all measurements collected. Record on the sampling log if any parameter readings are anomalous or unstable due to instrument problems.
- 13) Indicator parameters are considered stabilized when three consecutive readings made several minutes apart fall within the following EPA stabilization criteria:

pH	+/- 0.1 pH units
Specific conductance	+/- 3% ($\mu\text{S}/\text{cm}$ or mS/cm units)
ORP	+/- 10 millivolts
Turbidity	+/- 10% NTU units (when turbidity is >10 NTUs)
Dissolved oxygen	+/- 0.3 mg/L
Temperature	+/- 2° Celsius.
- 14) Record observations on sample appearance, clarity, and odors during purging and sampling. Collect water samples and complete the sampling activity following Steps 10, and 11 above.

SAMPLING PROCEDURE - INACTIVE SUPPLY WELLS WITH DEDICATED PUMPS

If the supply well is inactive (i.e., not used for routine or daily production), the well needs to be operated and purged before water samples are collected. A 'minimum purge' with stabilized field parameters sampling method is used. This SOP assumes both the power supply and the dedicated pump are operational (notify the Project Manager or Field Team leader if pump or power is not operational). Detailed information should be maintained on these type of wells and the data qualified as not likely to be representative of the aquifer.

- 15) Use the water level determined in Step 7 above and the total depth provided in the PST and/or the well-specific purge log to measure the standing water column in the well and calculate one casing volume.
- 16) Install a flow-through cell to the sampling port for measuring water quality parameters (pH, conductivity, temperature, turbidity, dissolved oxygen, temperature, and ORP). If it is not possible to connect the flow-through cell, a clean 5-gallon bucket may be used, as described in Step 8 above. Record units and time for all measurements collected. Record on the sampling log if any parameter readings are anomalous or unstable due to instrument problems.

- 17) Well purging will take place for a **minimum of 20 minutes, or until one well casing volume has been removed (whichever occurs first) and field parameters have stabilized** (see Step 13 above).
- 18) Record observations on sample appearance, clarity, and odors during purging and sampling. Collect water samples and complete the sampling activity following Steps 10, and 11 above.

INVESTIGATION-DERIVED WASTE MANAGEMENT

Different types of potentially-contaminated investigation-derived waste (IDW) will be generated during groundwater sampling efforts. These may include:

- Used personal protective equipment (PPE).
- Disposable sampling equipment.
- Decontamination fluids.
- Purged groundwater and excess groundwater collected for sample container filling.

Used PPE and disposable equipment will be placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of that could still be reused will be rendered inoperable before disposal in the refuse dumpster.

Regarding disposal of wastewater (decontamination water, and purge and excess groundwater):

- Active supply wells (pumping and not pumping): all wastewater generated during sampling of active supply wells will be discharged directly to the ground at the well site.
- Inactive supply wells: all wastewater generated during sampling of wells will be containerized and disposed of as instructed by PG&E: dispose of at the Central or Source IRZ holding tanks

SOP-A6

Purging and Sampling of Supply Wells without Dedicated Pumps Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for groundwater sampling of water supply wells that are **not equipped with dedicated production/sampling pumps** at the PG&E Hinkley site. This SOP specifically addresses the inactive, idle or abandoned agricultural, domestic, and other water supply wells that do not have dedicated functional pumps.

All samples for water quality (WQ) parameter measurement and laboratory analysis are collected using a temporary submersible sampling pump with a controllable discharge rate, such as the Grundfos Redi-Flo 2 (or similar pump) and flow controller.

The inactive water wells without pumps are typically large-diameter (6-inch or greater diameter casing) and have long perforated/screen intervals, and therefore, the purging and sampling procedures are different from the procedures used for sampling groundwater monitoring wells. A 'minimum purge' with stabilized field parameters sampling method is used as described below.

REQUIRED DOCUMENTS

- Event-specific "planned sampling and analysis table" (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction and previous depth to water information is provided in the PST.
- Blank purge and sampling log sheets.

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) To avoid cross-contamination, on-site decontamination of the temporary pump and all non-dedicated sampling equipment is mandatory prior to first sampling and between each well. Equipment decontamination will include flushing of the internal components of the submersible pump and tubing assembly dedicated for each well cluster, as well as external washing of the pump and submerged tubing with Alconox solution and fresh water rinsing. See SOP-A12, *Decontamination of Water Sampling Equipment*, for additional equipment decontamination procedures.
- 3) Field-check and setup sampling equipment: water level (WL) meter, water quality (WQ) meters, flow-through cell, temporary pump, pump control, power supply, new dedicated tubing, field filter, and health and safety equipment, etc. Inspect and calibrate field equipment prior to use according to SOP-A11, *Calibration of Field Instruments*.
- 4) Inventory sample bottles, review required analyses, confirm the lab courier schedule, and prepare groundwater sampling log.

- 5) Open well protection lid and measure initial static WL according to SOP-A9, *Water Level Measurements*. Record the WL value on the sampling log. Always measure water level before temporarily removing any pressure transducer, according to SOP-C1, *Temporary Removal and Replacement of Pressure Transducers*.

PURGING AND SAMPLING PROCEDURES – SUPPLY WELLS WITHOUT DEDICATED PUMPS

- 6) The temporary pump assembly will be lowered to the **mid-screen target sampling depth** for purging and sampling. Confirm the well screen interval in feet below top of casing (feet TOC). The well pump intake shall be placed at the mid-screen depth, feet TOC, ± 1.0 foot.
- 7) Use the water level determined in Step 5 above and the total depth provided in the PST and/or the well-specific purge log to measure the standing water column in the well and calculate one casing volume, as described on the groundwater purging and sampling log sheet.
- 8) Well purging will take place until a **minimum of one well casing volume has been removed and field parameters have stabilized (field parameters have changed from the initial readings and then stabilized)**. The purging rate shall be adjusted to obtain minimal drawdown. Field parameters (pH, specific conductance, temperature, ORP, dissolved oxygen, and turbidity) will be measured using a flow-through cell and the units indicated on the purge form.

pH	+/- 0.1 pH units
Specific conductance	+/- 3% ($\mu\text{S}/\text{cm}$ or mS/cm units)
ORP	+/- 10 millivolts
Turbidity	+/- 10% NTU units (when turbidity is >10 NTUs)
Dissolved oxygen	+/- 0.3 mg/L
Temperature	+/- 2° Celsius.
- 9) Indicator parameters are considered stabilized when three consecutive readings made several minutes apart fall within the following EPA stabilization criteria:
 - 10) Decrease the purge rate and measure/record new purge rate if significant drawdown is observed. Significant drawdown is considered to be 5% of the total height of the water column or to the top of screen. Record units and time for all measurements collected. Record on the sampling log if any parameter readings are anomalous or unstable due to instrument problems.
 - 11) Collect samples for analyses according to the PST and/or event-specific field instructions. For all samples, decrease the discharge rate to reduce water turbulence at the pump discharge point. To reduce or prevent the need to stop the pump between purging and sampling and to regulate the flow through the flow-through-cell during purging a dedicated inline splitter (“Y Valve”) will be used upstream from the flow-through-cell. The splitter will have one influent and two effluent lines. One effluent line will be attached to the flow-through-cell and from there to waste; the second effluent line will be used as the sampling port. Each effluent line should be capable of flow control. If the PST calls for filtered and/or preserved samples, refer to SOP-A8, *Sample Field*

Filtration and Preservation for Metals. Record observations on sample appearance, clarity, and odors.

- 12) Complete the field sampling log, including description of samples collected, final WL, and total volume purged. Close and secure the well including access gates or fences.

LOW VOLUME AND POOR RECOVERY WELLS

Refer to Hinkley SOP-A2 for procedures for purging and sampling water wells that exhibit slow or poor recovery upon purging.

INVESTIGATION-DERIVED WASTE MANAGEMENT

Different types of potentially-contaminated investigation-derived waste (IDW) will be generated during groundwater sampling efforts. These may include:

- Used personal protective equipment (PPE).
- Disposable sampling equipment.
- Decontamination fluids.
- Purged groundwater and excess groundwater collected for sample container filling.

Used PPE and disposable equipment will be placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of that could still be reused will be rendered inoperable before disposal in the refuse dumpster.

All wastewater (decontamination water, and purge and excess groundwater) generated during sampling of monitoring wells will be containerized and disposed of as instructed by PG&E: dispose of at the Central or Source IRZ holding tanks.

SOP-A7

Purging and Sampling of Active Domestic Wells with Dedicated Pumps Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for groundwater sampling of active domestic wells that are equipped with dedicated and functional well pumps at the PG&E Hinkley site.

Samples for water quality measurement and laboratory analysis are collected directly from existing or installed sampling ports at the well head/discharge piping. Samples are not collected from holding tanks.

The active domestic wells are typically larger in diameter and usually have long perforated/screen intervals when compared to monitoring wells. Therefore, the purging and sampling procedures for these wells are different from the procedures used for sampling conventional groundwater monitoring wells.

WELL SURVEY

Prior to sampling a domestic well for the first time, a well survey will be conducted to determine if the well is fit for sampling. The well survey process is outlined below and documented in the Well Survey Form.

- 1) Confirm and note the operation status (e.g., active) of the domestic well from wellhead meter (if present) or well owner information provided during the sampling appointments with the owners. When possible, inspect and/or confirm the condition of the well, wellhead, and associated aboveground piping.
- 2) Confirm the presence or absence of a sampling port (a.k.a. spigot or hose bib), pressure relief valve, holding tank, and backflow valve in the tank. Determine whether a well retrofit is needed for the installation of a sampling port before the holding tank.
- 3) If a well retrofit is necessary to for sample collection, the well owner will be consulted before modifying the well and pump system and request his/her consent. If needed, install a sampling port as close as possible to the wellhead. The most common procedure for this retrofit is to remove the pressure relief valve from the wellhead or pipe and install a small pipe extension with a sampling port and re-install the pressure relief valve at the end of the pipe extension.

DOMESTIC WELL SAMPLING

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- If available, well construction and previous depth to water information will be included in the PST.

- Blank purge and sampling log sheets

PREPARATION AND SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) Field-check and setup sampling equipment: water level (WL) meter, water quality (WQ) meters, flow-through cell, field filter, purge water container, health and safety equipment, etc. Inspect and calibrate field equipment prior to use according to SOP-A11, *Calibration of Field Instruments*.
- 3) Inventory sample bottles, review required analyses, confirm the lab courier schedule, and prepare groundwater sampling log.

PURGING AND SAMPLING PROCEDURES FOR DOMESTIC WELLS

- 4) If an access port is present in the wellhead seal, and consent has been given by the owner, a water level measurement will be taken from the domestic well. Measure initial static water level according to SOP-A9, *Water Level Measurements*. Record water level value on sampling log.
- 5) Install a flow-through cell to the sampling port and record a set of water quality parameters (pH, conductivity, temperature, turbidity, dissolved oxygen, temperature, and ORP). If it is not possible to connect the flow-through cell, a clean 5-gallon bucket may be used by filling the bucket with purge water and inserting the instrument probes directly into the bucket. If the bucket is used, turbulence in the bucket should be minimized and only pH, conductivity, ORP, and temperature need to be recorded. Record units and time for all measurements collected. Record on the purge form if any parameter readings are anomalous or unstable due to instrument problems. Re-calibrate instruments if needed.
- 6) Purge the well for **a minimum of five minutes** to ensure that water contained in the pump, riser pipe, and associated plumbing has been purged. The final purged volume and purge time will depend on the specific well system and the dedicated pump flow rate. In any case, the sample should be collected after the well has been pumped long enough to remove standing water and to ensure that water from the producing formation/s has entered the well casing.
- 7) Samples will be collected directly from the sampling port. A single set of field parameters should be recorded (collecting stabilized field parameters is not required). Record observations on sample appearance, clarity, and odors.
- 8) Collect samples for analyses according to the PST and/or event-specific field instructions. Sample containers are to be filled by transferring water directly from the sampling port to the appropriate sample container. If the PST calls for **filtered and/or preserved samples**, refer to SOP-A8, *Sample Field Filtration and Preservation for Metals*.
- 9) Complete the field sampling log, including description of samples collected, final WL, if possible, and estimated purge volume of discharge or purge. If the pump is equipped with a flow meter, record the flow rate as well. Close and secure the well including access gates or fences.

INVESTIGATION-DERIVED WASTE MANAGEMENT

Different types of potentially-contaminated investigation-derived waste (IDW) will be generated during groundwater sampling efforts. These may include:

- Used personal protective equipment (PPE).
- Disposable sampling equipment.
- Decontamination fluids.
- Purged groundwater and excess groundwater collected for sample container filling.

Used PPE and disposable equipment are not considered hazardous wastes and can be sent to a municipal landfill. These wastes should only be disposed of in approved dumpsters controlled by PG&E or their contractors. Any PPE and disposable equipment that is to be disposed of that could still be reused will be rendered inoperable before disposal in the refuse dumpster.

Regarding disposal of wastewater (decontamination wash water, and purge and excess groundwater):

- Typically, wastewater generated during sampling of domestic wells will be discharged directly to the ground at the well site. If a large volume of purge water will be generated, the property owner must be consulted to verify that the water can be applied to ground on their property. Otherwise, any wastewater removed from the well site must be contained and transported to an approved disposal location.

SOP-A8

Sample Field Filtration and Preservation for Metals Analyses Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for collecting groundwater samples for field filtered metals analyses at the Hinkley site. Refer to SOP-A1 through SOP-A7 for specific groundwater sampling methods.

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction and previous depth to water information in provided on the PST.
- Blank purge and sampling log sheets.

FIELD-FILTRATION AND SAMPLE COLLECTION PROCEDURES FOR GROUNDWATER FROM MONITORING AND SUPPLY WELLS

- 1) Follow SOP-A1 through SOP-A7.

Sample Collection

Samples with turbidity greater than 10 NTU will be filtered through two inline 0.45 micron filters, as discussed in Technical Memorandum “*Use of Dual In-line Filters to Mitigate Erroneous Results Associated with Elevated Turbidity*” (CH2M HILL January, 2011). Samples with turbidity less than 10 NTU will be filtered through one inline 0.45 micron filter.

- 1) Once the required volume of purge water has been removed and the field parameters are stabilized, connect previously unused inline 0.45 micron filter(s) to the sampling port side of the splitter. Remember — do not change the speed of the pump. Filters must be certified and provided by CH2M HILL.
- 2) Purge 500 to 1000 milliliters (ml) of water through the inline filter(s) before collecting any samples.
- 3) Collect a post filter turbidity sample and record on the purge form.
- 4) For hexavalent chromium and dissolved metals: fill a 1 liter non-preserved sample container to the bottom of the bottle neck and replace the lid, invert the bottle 2 or 3 times to ensure the sample is homogeneous and then transfer (decant) the sample into the pre-preserved bottles required by the PST.

Dissolved Metals Method SW 6010B and SW 6020A (including Title 22 Metals)

- a) Fill a laboratory provided pre-preserved sample bottle (500 ml poly containing nitric acid [HNO_3]) with the sample to the top of the bottle neck. Care must be taken not to overfill the bottle.
- a) Seal, label, and place the sample on ice.

Hexavalent Chromium Method SM3500 and 218.6

- a) Fill a laboratory provided pre-preserved sample bottle (250 ml poly containing $(\text{NH}_4)_2\text{SO}_4/\text{NH}_4\text{OH}$ buffer solution) to the top of the bottle neck. Care must be taken not to overfill the bottle.
- a) Seal, label, and place the sample on ice.

SOP-A9

Water Level Measurements

Standard Operating Procedure for

PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) addresses the procedures and equipment to be used for manually measuring the depth to water at surface water locations, groundwater monitoring wells, supply wells, and domestic wells.

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction and previous depth to water information.
- Blank purge and sampling log sheets.

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) Ensure that the water level meter has been decontaminated. If the water level meter is not noted as decontaminated in the field notes, decontaminate the lower five feet of the water level meter before using according to SOP-A12, *Decontamination of Water Sampling Equipment*.
- 3) Inspect all equipment and calibrate water level meters if multiple meters are being used according to SOP-A11, *Calibration of Field Instruments*.
- 4) If well is equipped with a transducer, and transducer removal is required for water level measurement/sampling, follow SOP-C1, *Temporary Removal and Replacement of Transducers*.

MEASUREMENT PROCEDURES

- 5) Place water level meter into well or and lower until sensor sounds. Shake the line to remove any retained water. Note depth to water (DTW) measurement to mark on well casing, if there is no mark on casing measure to the north. Repeat three times and record final DTW to the nearest hundredth of a foot on the sampling log. Record well identification, time, date, DTW, and water level meter number.
- 6) Compare DTW measurement with previous data and note discrepancies on the sampling form. Repeat step #5 if an unexpected discrepancy is noted.
- 7) Decontaminate the lower five feet of water level meter or any portion of the instrument that came in contact with water, by unwinding the tape of the meter and following SOP-A13, *Decontamination of Water Sampling Equipment*. Record decontamination procedures and the serial number of the water level meter in the field book.

SOP-A10

Field Water Quality Measurements Using a Flow-through Cell Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This Standard Operating Procedure (SOP) provides general guidelines for using the YSI 556 or YSI Professional Plus Water Quality meter and flow-through cell or similar device for field measurements of pH, specific conductance, turbidity, dissolved oxygen, oxidation-reduction potential (ORP), and temperature of groundwater samples. The manufacturer's manual should be consulted for detailed calibration and operating procedures.

REQUIRED DOCUMENTS

- Event-specific "planned sampling and analysis table" (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Equipment Manufacturer Manuals
- Blank purge and sampling log sheets

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions, HSP, Equipment Procedures Manual, and initiate sampling logs for sampling activity.
- 2) Inspect all equipment: YSI 556 or YSI Professional Plus Water Quality Meter with flow-through cell, or similar device; distilled water in squirt bottle.
- 3) Prior to each day's use, clean the probes and flow-through cell according to manufacturer's directions and calibrate the field water quality (WQ) meters according to SOP-A11, *Calibration of Field Instruments*.

The YSI 556 or YSI Professional Plus Water Quality Meter is capable of measuring the following parameters:

Parameter	Range of Measurement	Accuracy
pH	0 – 14 pH	+/- 0.2 pH units
Specific Conductivity	0 – 100 mS/cm	+/- 0.5 % of reading to 0.001mS/cm
Dissolved Oxygen	0 – 50 mg/l	+/- 0.2 mg/l Depending on DO probe
Temperature	-5 – 50 °C	+/- 0.15 °C
ORP	-999 mv - +999 mv	+/- 20 mV in redox solution
Salinity	0 – 70 ppt	+/- 1.0 % of reading or .1 ppt whichever is greater

SAMPLE MEASUREMENT PROCEDURES

- 1) Connect the discharge tubing from the pump to the inlet side (bottom port) of the flow-through cell.
- 2) Connect the discharge tubing to the outlet side (top port) of the flow-through cell.
- 3) Place the discharge tube in a purge water collection vessel.
- 4) Record the time and start the pump.
- 5) Establish a suitable discharge rate of the pump that is consistent with the PST and guidance.
- 6) Allow the well drawdown to stabilize and the temperature of the flow-through cell to equilibrate with the water temperature.
- 7) Turn the meter on to the measure mode.
- 8) Record water quality readings at regular intervals every three to five minutes. Keep in mind that the time interval between successive readings should not be shorter than the recharge time of the flow-through cell. For example, if the volume of the flow-through cell is 375 mL and the stabilized discharge rate is 137 mL/minute, the water quality readings should be at least 3 minutes apart.
- 9) Record the water quality information, volume of water discharged, the ending water quality characteristics, the ending water level, and the sample time and number in the field logbook and/or field sampling data sheet, if used.

Key Checks and Preventive Maintenance

- Calibrate meter according to SOP-A11, *Calibration of Field Instruments*.
- Clean probe with distilled water when done.
- If probes are dirty, rinse with a weak Alconox solution in the flow-through cell. If the device still does not calibrate, rinse with weak Alconox solution, isopropyl alcohol, Alconox, and rinse well with distilled or tap water.
- Store device using tap water. Use of deionized water will ruin the probes.
- Refer to operations manual for recommended maintenance.
- Check batteries, and have a replacement set on hand.

SOP-A11

Calibration of Field Instruments Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) addresses the procedures and equipment to be used for calibration of field instruments at the Hinkley site. This SOP should be used for calibration of water level meters (Heron or Solinst), water quality meters (YSI 556 or YSI Professional Plus) with flow-through cell and HACH turbidity meters.

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Equipment Manufacturer Manuals
- Previous Calibration Records
- Field Equipment Binder (documents equipment servicing, calibration, etc..)
- Blank Calibration Sheets (see attached)

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions and HSP.
- 2) Inspect all equipment necessary to carry out activities detailed in event-specific PST.
- 3) Calibration should be performed prior to initiating sampling each day. Always use fresh solutions for calibration
- 4) Review Field Equipment Binder equipment servicing records to anticipate next service.
- 5) All equipment and solutions are stored in an air-conditioned office onsite to maintain the integrity. Due to extreme temperature at the site, all calibrations are performed within this office.
- 6) The Heron or Solinst water level meters shall be used as the principal field instruments for measuring depth to water in wells.
- 7) The YSI 556 or YSI Professional Plus water quality meter shall be used as the principal field instruments for measuring water quality parameters during groundwater sampling.

EQUIPMENT NEEDED

Water Level Meter:

- Surveyor's tape measure

YSI 556 or YSI Professional Plus Water Quality Meter:

- Calibrating solutions
- Spare batteries
- DI water

HACH Turbidity Meter:

- Autocal solution
- Level II solution
- ORP check solution
- Spare batteries
- DI water

CALIBRATION PROCEDURES

Water Level Meters

When using a single water level meter:

- 1) Unroll and extend the water level meter tape to its full length
- 2) Extend a surveyor's tape measure (graduated in 0.01-ft increments) next to the water level meter tape
- 3) Starting from the zero-foot mark on both the water level meter and surveyor's tapes, compare the markings down the entire length of the two tapes at ten-foot increments. On the water level meter calibration sheet, note next to the water level tape distances what the corresponding distance is on the surveyor's tape (i.e., water level distance - 10 feet; surveyor's tape distance - 10.01 feet)

When using multiple water level meters at the site it is necessary to calibrate each against each other at least once during the sampling event (usually the first day before the site-wide water level snapshot) using the following procedure:

- 4) Lower each water level meter into a specified well and record the reading to the nearest hundredth of a foot on the calibration sheet along with water level meter number, time, and date.
- 5) If there are two or more water level meters being used and they are reading different depths to water with a difference bigger than 0.01 of a foot:
 - a) Repeat steps #1 through #3 for all the water level meters

- b) If the measured distance between the water-level meters do not correspond with the measurements taken with the surveyor's measure tape (difference bigger than 0.01) then mark and affix a tag to the water level meter with the measurement calibrated offset distance in ft

Water Quality and Turbidity Meters

Check expiration date of calibration solution and discard if expired. For calibration instructions, please refer to specific Equipment Manufacturer Manuals

SOP-A12

Decontamination of Water Sampling Equipment Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) describes the procedures and equipment to be used for decontamination of sampling equipment at the Hinkley site.

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).

PREPARATION & SETUP

- 1) Initiate field log sampling book for activity.
- 2) Inspect all equipment necessary to carry out activities detailed in event-specific PST.
- 3) Review manufacturer decontamination guidelines for equipment necessary to carry out activities.

Equipment List:

- 1) Spray bottle with distilled water.
- 2) Spray bottle with 2.5 percent (W/W) Alconox and distilled water solution.
- 3) Large plastic pails, tubs and 5-gallon buckets for Alconox and distilled water, scrub brushes, squirt bottles for Alconox solution, distilled water, and clean plastic bags.
- 4) Trash pump to transfer used decontamination water from tubs to holding tank for disposal of waste.
- 5) Phthalate-free gloves.

GUIDELINES

Field Equipment

Any equipment used (temporary pump, dedicated pump power supply line, hose claps, etc.) will be decontaminated before use and between each sampling location.

Water Level Meters

Any portion of a water-level indicator (e.g. probe and/or cable) that contacts the groundwater must be decontaminated by washing with Alconox or Liquinox solution and rinse with distilled water after use.

Pumps/Probes/Cables

Sampling pumps, probes (e.g., pH or specific ion electrodes, geophysical probes, etc.) and/or cables that come into contact with groundwater will be decontaminated using the

procedures specified below unless manufacturer's instructions indicate otherwise. For probes that make no direct contact (e.g., OVM equipment), the probe will be wiped with paper towels.

PROCEDURES

Sampling Equipment Decontamination – Groundwater Sampling Pumps

Sampling pumps are decontaminated after each use as follows:

- 1) Don phthalate-free gloves.
- 2) Turn off pump after sampling. Remove pump from well and place pump in decontamination tub, making sure that tubing does not touch the ground.
- 3) Turn pump back on and pump 1 gallon of Alconox solution through the sampling pump.
- 4) Rinse with a minimum of 1 gallon of distilled water.
- 5) Keep decontaminated pump in decontamination tub or remove and wrap in clean plastic sheeting or clean plastic garbage bag.
- 6) Collect all rinsate and dispose of at the Central or Source IRZ holding tanks as instructed by PG&E.
- 7) Decontamination materials (e.g., plastic sheeting, tubing, etc.) that have come in contact with used decontamination fluids or sampling equipment will be placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of that could still be reused will be rendered inoperable before disposal in the refuse dumpster.

Sampling Equipment Decontamination – Other Equipment

Reusable sampling equipment is decontaminated after each use as follows.

- 1) Don phthalate-free gloves.
- 2) Wash all equipment surfaces that contacted the potentially contaminated soil/water with Alconox solution.
- 3) Rinse with distilled water or triple rinse with potable water.
- 4) Air dry and wrap exposed areas with plastic sheeting or a clean plastic garbage bag for transport and handling if equipment will not be used immediately.
- 5) Collect all rinsate and dispose of in a DOT-approved 55-gallon drum or holding tank.
- 6) Decontamination materials (e.g., plastic sheeting, tubing, etc.) that have come in contact with used decontamination fluids or sampling equipment will be disposed of in DOT-approved 55-gallon drums.

KEY CHECKS AND ITEMS

- Clean with solutions of Alconox and distilled water.
- If necessary, decontaminate the outside of filled sample bottles before relinquishing them to anyone.
- All materials generated during sampling (debris, PPE, decontamination liquids, etc.) will be placed in 55-gallon drums or rolloff bins for storage pending analysis and disposal off site.
- Document all decontamination procedures in the field log book. Prior to use of equipment during a sampling event, check log book to see that equipment was decontaminated, if not proceed with decontamination procedures prior to use. At the end of an event, tag equipment as decontaminated with initials and date. Remove the tag prior to use at the beginning of the next event. If at the beginning of a sampling event this tag is not visible or complete, proceed with decontamination of equipment.
- The effectiveness of field cleaning procedures will be monitored by rinsing decontaminated equipment (i.e. portable pump) with organic-free water and submitting the rinse water in standard sample containers for analysis. The minimum number of equipment blank samples will be at least one per team (per event), per piece of equipment decontaminated, during large-scale field sampling efforts.

SOP-A13

Measurement of Well Total Depth Standard Operating Procedure for PG&E Hinkley Groundwater Monitoring Program

This standard operating procedure (SOP) addresses the procedures and equipment to be used for manually measuring the total depth (TD) at groundwater monitoring wells and supply wells. TD measurements will be recorded in the groundwater sampling forms (purge forms). These TD measurements will be included in the event-specific PST for each sampling event.

REQUIRED DOCUMENTS

- Event-specific “planned sampling and analysis table” (PST).
- Applicable project work plan or monitoring plan, and related Hinkley SOPs as needed.
- Hinkley Program Health and Safety Plan (HSP).
- Well construction information (provided in PST).
- Previous TD data.
- Blank purge and sampling log sheets.

PREPARATION & SETUP

- 1) Review event-specific PST or event-specific field instructions, HSP, previous sampling logs, and initiate field logbook for sampling activity.
- 2) Ensure that the water level meter has been decontaminated or decontaminate as needed following SOP-A12, *Decontamination of Water Sampling Equipment*.
- 3) If a transducer is present in the well and it is necessary to remove transducer to allow well access, refer to SOP-C1, *Temporary Removal and Replacement of Transducers*.

MEASUREMENT PROCEDURES

- 4) Place water level meter into well and lower until the bottom of the probe touches the bottom of the well. Note TD measurement to mark on well casing, if there is no mark on casing measure to the north. Repeat three times and record final TD to the nearest hundredth of a foot on the log. Also note the condition of the well bottom (i.e. hard bottom, soft bottom). Record well identification, time, date, and TD.
- 5) Compare TD measurement with previous data and note discrepancies on the sampling form. Repeat step #6 if an unexpected discrepancy is noted.
- 6) Decontaminate the entirety of the measuring tape, or any portion of the instrument that came in contact with water, following SOP-A12, *Decontamination of Water Sampling Equipment*.

Abbreviations:

µS/cm = microsiemens per centimeter

°C = degrees celcius

ft = feet

FQ = Field measurement qualified as questionable due to reading outside expected range.

mg/L = milligrams per liter

mV = millivolts

nm = parameter was not measured

NTU = nephelometric turbidity units

ORP = oxidation reduction potential

ppt = parts per thousand

Table D-1
Groundwater Level Measurements
Second Quarter 2021 Groundwater Monitoring Report and Domestic Well Sampling Results
Site-wide Groundwater Monitoring Program
Pacific Gas and Electric Company, Hinkley Compressor Station, Hinkley, California

Notes:

^a Data presented on this table are water levels collected during the sitewide groundwater monitoring and sampling events. In addition to manual water levels, monthly transducer averages from select monitoring well locations are also used to create sitewide groundwater contours. These transducer averages are reported in their respective Hydraulic Capture Monitoring Reports.

Some measuring point elevations are estimated based on available information; therefore, some groundwater elevations are approximate.

Dry wells are not shown on this table.

Abbreviations:

ft = feet

MP = well measure point (either top of steel well casing or top of plastic well casing)

msl = above mean sea level

nr = not reportable

ns = not surveyed
